BEFORE THE ENVIRONMENTAL QUALITY COUNCIL STATE OF WYOMING

IN THE MATTER OF REVISIONS)	
TO WATER QUALITY RULES AND)	STATEMENT OF
REGULATIONS, CHAPTER 17,)	PRINCIPAL REASONS
STORAGE TANKS AND CHAPTER 19,)	FOR ADOPTION
FINANCIAL ASSURANCE FOR)	
UNDERGROUND STORAGE TANKS)	

INTRODUCTION

The Environmental Quality Council, pursuant to the authority vested in it by Wyoming Statute 35-11-112(a)(i) has adopted revisions to the following chapters of the Wyoming Water Quality Division Rules and Regulations: Chapter 17, Storage Tanks, and Chapter 19, Financial Assurance for Underground Storage Tanks.

Per the Streamlining Government Initiative, one chapter (Chapter 19) has been eliminated by combining it with Chapter 17 (50% reduction). Between the two chapters, the reduction in pages is 35 (24% reduction).

Section 35-11-1416(a) of the Environmental Quality Act (Act) states: "The council shall promulgate rules and regulations necessary to administer this article after recommendation from the director of the department, the administrators of the various divisions and their respective advisory boards. The rules shall include but shall not be limited to rules and regulations which:

- (i) Provide for performance, operating and installation standards for underground storage tanks which shall be no less or no more stringent than the federal standards.
 - (ii) Require proof of financial assurance as required by federal law."

Water Quality Division Rules and Regulations Chapter 17 contains standards for: 1) upgrading existing storage tank facilities; 2) tank abandonment and closure; 3) tank compatibility with stored substances; 4) new tank construction, design, and installation; 5) record maintenance; 6) release detection; 7) spill and overfill devices; 8) inspection procedures; 9) compliance deadlines; and 10) soil and groundwater restoration. The rules include standards for underground storage tanks (USTs), as required by federal law, and state-regulated aboveground storage tanks (ASTs). Standards developed in the rules are those determined by the council to be necessary to meet the goals of the statute.

Water Quality Division Rules and Regulations Chapter 19 contains financial assurance requirements for underground storage tanks as required by federal law.

These proposed rule changes: 1) move Chapter 17 Water Quality Division Rules and Regulations to Solid and Hazardous Waste Division, Storage Tank Program, Chapter 1 as authorized during the 2017 legislative session (Section 35-11-1415 of the Act); 2) are in response to changes in the October 2015 federal law to implement the 2005 Energy Policy Act; 3) address previously deferred tanks that as of October 2015 are no longer deferred by federal law; 4) move the full citation for all standards, codes of practice, and references to Section 2; 5) include new technologies that were not available when the federal law was written in 1988; 6) update standards, codes of practice, and references; 7) remove references to old dates; 8) make editorial, formatting, and technical corrections; 9) provide aboveground owners and/or operators the option of obtaining financial assurance; and 10) move Water Quality Division Rules and Regulations Chapter 19 (Financial Assurance for Underground Storage Tanks) into Solid and Hazardous Waste Division, Storage Tank Program, Chapter 1.

PROPOSED REVISIONS TO CHAPTER 17 (NOW CHAPTER 1)

Throughout the Chapter:

Substantive:

- 1) Add new EPA regulations that became effective October 13, 2015.
- 2) Add existing EPA regulations (pre-2015) that were not included in the Chapter.

Not Substantive:

- 1) Editorials, including editorial changes made by EPA to existing language and to meet the Franklin Covey Style Guide for technical writing.
 - 2) Clarifications.
- 3) Update references, publications, etc. and cite Section 2 for complete reference citation.
- 4) Remove language no longer relevant due to: a) new regulations, b) changes to the rules, c) 2017 statute revisions, d) language not in the federal rules, or e) dates for compliance have passed.
- 5) Chapter 17 is now Chapter 1 of the Storage Tank Program (STP) under Solid and Hazardous Waste Division (STP was moved from Water Quality Division to Solid and Hazardous Waste Division (SHWD) during the 2017 legislative session).

Part A

Substantive:

1) Section 4: EPA removed the deferral for some tank that were previously deferred from regulations. Section revisions were made to reflect the tanks no longer deferred and the portions of the regulations that now apply to those tanks. Previously deferred tank language has been included, verbatim from the federal regulations, as Section M.

Not Substantive:

- 1) Section 1: Change statute references to reflect 2017 legislative changes.
- 2) Section 2: Change SHWD address to phone number.
- 3) Section 2: Move the complete citation for each reference, publication, etc., referenced throughout the Chapter to Section 2. This move cleans up the Chapter, puts all

references and their citations in one place, and reduces the number of pages in the rule. All references were updated in 2017.

- 4) Section 3: Move WQD Rules and Regulations Chapter 19 (Financial Assurance for Storage Tanks) into this new Chapter 1 as Part N to reduce the number of Chapters per the governor's initiative. Chapter 19 has been moved as Part N; minor editorial changes were made to Part N.
- 5) Section 3: Give AST owners the option for financial responsibility coverage per the 2017 statute.
 - 6) Section 4: Revise for clarity.
- 7) Section 5: Update and add definitions needed to address the Chapter and 2017 statute revisions. Removed some definitions that are in the Code of Federal Regulations (CFR) and not routinely used by the regulated public.

Part B

Substantive:

- 1) Section 6: All new tanks and piping must be secondarily contained and interstitially monitored. This requirement was put into rule in December 2005 in response to the Energy Policy Act. EPA exempted some suction piping; however, W.S. 35-11-1429 does not allow for the exemption. Therefore, the EPA exemption has not been included in the rules.
 - 2) Section 6: Added restrictions on using flow restrictors in vent lines (ball valves).
 - 3) Section 6: Spill and overfill prevention equipment must be tested/inspected.
 - 4) Section 6: Under dispenser containment is now required.
- 5) Section 6: Added flow restriction requirements to prevent overfills. Language was not in Chapter 17 but is in the federal rules.
- 6) Section 7: Permanently closed substandard USTs cannot be brought back into service if they do not meet the standard requirements.
 - 7) Section 8: Allows repair of non-corrodible pipes and fittings.
- 8) Section 8: Repairs of spill and overfill prevention equipment must be tested after the repair.
- 9) Section 8: Clarification of the intent of the Statute and EPA regulations that all new and replacement tanks must be double-wall and interstitially monitored for the lifetime of the system. If either the primary or secondary tank wall fails, the tank is no longer being operated as it was designed to be operated.

Not Substantive:

1) Section 6: All tanks were required to install cathodic protection by June 30, 2008, per W.S. 35-11-1429(a). Language has been updated to reflect the 2008 date.

Part C

Substantive:

- 1) Section 9: Requirement to notify the department with change of ownership within 30 days.
- 2) Section 10: Requirement for periodic testing of spill prevention equipment and containment sumps used for interstitial monitoring of piping and periodic inspection of overfill prevention equipment.

- 3) Section 11: W.S. 35-11-1429(a) requires that cathodic protection be installed and operated on all internally lined tanks no later than June 30, 2008. The federal regulations have no timeframe to complete repairs on these systems. Included clarification to prevent having to issue a Red Tag (delivery prohibition) for not completing the repairs within 90 days of failure. This will assist tank owners/operators to remain in compliance and reduce the chance of delivery prohibition.
- 4) Section 12: Requirements for compatibility of substance being stored with the tank system.
 - 5) Section 13: New notification requirements.
 - 6) Section 13: New recordkeeping requirements.
 - 7) Section 13: Requirements for inspections by the Class A and B operators.
 - 8) Section 13: Provide option to allow submittal of electronic records.
- 9) Section 13: Clarification that if the owner/operator does not open access points (required) for DEQ inspectors and the equipment is damaged during inspection, the cost for repairs will be incurred by the owner/operator and not DEQ.
 - 10) Section 13: Added notification requirements required by statute.
- 11) Section 13: Clarification of sump sensor placement for EPA-required detection of 3 gallons if sump sensors are used as automatic line leak detectors.

Not Substantive

- 1) Section 13: Annual reports must be submitted on forms approved by DEQ, and requires verification that the testing was completed by a licensed tester.
- 2) Section 13: Requires the tester to provide the owner/operator with the testing results so deficiencies can be corrected.
- 3) Section 13: Owners/operators may send permanent closure records to DEQ if they cannot be kept on site or at an alternate site.

Part D

Substantive:

- 1) Section 14: Release detection equipment must be operated, maintained, and tested.
- 2) Section 14: Previously deferred tanks must meet Part M requirements.
- 3) Section 14: Automatic line leak detectors are required on pressurized piping.
- 4) Section 14: Clarifies sump sensor placement when sump sensors are used as automatic line leak detectors.
- 5) Section 14: Added the 2017 statute that requires automatic shut off when sump sensors are used as standalone automatic line leak detectors.
- 6) Section 14: Leak detection requirements clarified per Petroleum Marketers Association of America (PMAA) regulatory report.
 - 7) Section 15: Manual tank gauging variations standards table revised.
 - 8) Section 16: Provided guidelines for automatic tank gauge testing.
 - 9) Section 16: Added requirements for Statistical Inventory Reconciliation.
- 10) Section 16: Clarifies that another method of inventory control can be used as long as the method meets the inventory control requirements per the federal regulations.
- 11) Section 16: Added the 2017 statute that requires when interstitial monitoring has been installed, it must remain as the primary leak detection method for the life of the tank or piping.

- 12) Section 16: Requires that interstitial monitoring records be kept so that DEQ can determine if interstitial monitoring is being done in accordance with the statute.
 - 13) Section 17: Hazardous substance UST containment systems must be monitored.
- 14) Section 18: Records of site assessments completed to use vapor or groundwater monitoring must be maintained as long as those methods are used, and site assessment must be stamped by a Wyoming Registered Professional Engineer or Geologist.
- 15) Section 18: Records for some forms of release detection for previously deferred USTs must be kept until the next test is completed.

Not Substantive:

1) Section 18: Tank tightness testing results must be maintained until the next test.

Part E

Substantive:

- 1) Section 19: Added that liquid in the tank interstice is considered an unusual operating condition and requires integrity testing as part of release investigation/confirmation.
 - 2) Section 19: Liquid found in the interstitial space must be removed.
 - 3) Section 19: Release reporting is required if an alarm occurs.
- 4) Section 19: If a release was contained and certain requirements are met, the release does not need to be reported.
- 5) Section 20: Require integrity test of outer wall if primary wall fails so that DEQ knows there has not been a release to the environment requiring state-funded cleanup.
- 6) Section 21: Added release investigation requirements for secondary containment failures.
- 7) Section 22: A release of a hazardous substance equal to or in excess of the reportable quantity must be reported immediately to the National Response Center in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA).

Not Substantive:

- 1) Section 19: Added requirement for confirmed spills to be reported to the local fire authority.
- 2) Section 22: Updated spill reporting procedures to reflect DEQ's current spill reporting requirements.
- 3) Section 24: Added language to alert owners that the Voluntary Remediation Program may be available to them if they are not eligible for the Corrective Action Account for cleanup.
- 4) Section 26: Added that all public notices are posted to the STP website to meet EPA community engagement initiative, STP guidance documents, and DEQ process for public notices.

Part F

Not Substantive:

- 1) Section 29: Added/clarified minimum site assessment (MSA) requirements for tank systems.
- 2) Section 29: Clarified how an operator notifies and obtains authorization to close or change the service of a tank and when the owner/operator is required to pay for the MSA.
- 3) Section 29: Clarified that owners must perform an MSA when undergoing a tank change-in-service.
- 4) Section 29: Added the 2017 statute requirement that an MSA must be completed when a tank has been temporarily out-of-use (TOU) for 12 months.
- 5) Section 29: Removed the specifics on monitoring well construction and added that the wells need to be approved by DEQ. This will allow flexibility when completing an MSA.
- 6) Section 29: Clarified that all lab work needs to be done by an A2LA or NELAP certified lab (required for all program work).
- 7) Section 29: Changes are primarily to clean up the Part and revisions to include when an MSA is required and how to complete the MSA. In general, the revisions will be less cumbersome on tank owners.

Part G

Substantive:

- 1) Section 30: Clarified that corrosion protection must be maintained on TOU USTs.
- 2) Section 30: Clarified that Class A and B operators are required for TOU tanks.
- 3) Section 30: Changed requirements for tanks in TOU status from 6 months to 3 months.
- 4) Section 30: Corrosion protection must be maintained on TOU ASTs. EPA is requiring corrosion protection for USTs. Therefore, DEQ will require the same for ASTs, which are not regulated by EPA.
- 5) Section 30: Added that when a tank is TOU for 12 months or longer, the tank must be closed or brought back into service per the 2017 statute.
- 6) Section 31: Added that owners/operators not eligible for the Corrective Action Account must begin cleanup.
- 7) Section 31: Added that owners/operators must maintain records demonstrating compliance with tank closure requirements.
- 8) Section 31: Added that an MSA is required to convert a tank to a non-regulated use or to a regulated use, even for contaminated sites, so DEQ knows what the conditions of the site are before converting uses. This will prevent the State from possibly cleaning up a site for contamination caused during non-regulated use.

Not Substantive:

- 1) Section 30: Require notification from the owner to place tanks in TOU status so DEQ can track that requirements for TOU tanks are being met.
 - 2) Section 31: Clarify that tanks become a solid waste after they have been removed.

Part H - None

<u>Part I – Part I provides AST requirements; ASTs are not regulated by EPA</u>

Substantive:

- 1) Section 35: Revised all testing and checks of AST systems to be on the same frequency as required by EPA for USTs. This reduces the burden on tank owners because the rules required testing and checks to be completed more frequently for ASTs than EPA required for USTs. This provides consistency between USTs and ASTs.
- 2) Section 35: Added that corrosion protection systems must be designed by a corrosion expert (as required for USTs).
- 3) Section 35: Added that all new and replacement underground piping on ASTs must be double-wall and interstitially monitored (as required for USTs per EPA and statute).
 - 4) Section 35: Require all ASTs to be labeled; not just UL-listed ASTs.
- 5) Section 35: Added that all new installations, upgrades, and modifications to an AST system must be inspected by DEQ; not just upgrades as currently in the rule.
- 6) Section 35: Revised requirements for tank openings and pipe connections to account for the types of tanks at facilities. This revision is less restrictive than currently in rule, but meets safety concerns.
- 7) Section 35: Revised tank lettering requirement, which will be less cumbersome on owners.
- 8) Section 35: Added compatibility requirements that are similar to EPA UST requirements.
- 9) Section 36: Revised inventory control requirements for ASTs. Some requirements for USTs are not necessary for ASTs because portions of the AST tank system are visible. The revision is less burdensome on tank owners.

Part J

Substantive

1) Section 40: Required that a Remedial Action Plan be submitted.

Not Substantive

- 1) Section 38: Clarifies that site data, if available, should be used to determine cleanup standards if conflicts occur using modeling.
- 2) Section 38: Clarifies that the state will only cleanup soil and groundwater contaminated by regulated substances. Clarifies that cleanup will only be completed to background levels if those are higher than the protection standards.

Part K

Substantive

- 1) Section 44: Changed the date that DEQ can prohibit fuel delivery to a tank (red tag) from September 1 to April 1 if fees are not paid by April 1. Fees are due by January 1 for the coming year. DEQ believes 3 months is adequate for the owner to pay the tank fees.
- 2) Section 44: Added the ability to red tag ASTs for the same violations as USTs. This will provide consistency between USTs and ASTs.
- 3) Section 44: Added the ability to red tag a tank if: a) a tank is being operated without department authorization; b) spill prevention equipment, containment sumps, or overfill prevention device testing has not been completed within 60 days of the due date; or c) pressurized piping is being operated without an automatic line leak detector.

4) Section 44: Added the ability for an owner/operator to receive a one-time fuel delivery at a red-tagged tank to conduct testing requiring fuel in order to come into compliance so the red tag can be removed.

Part L

Substantive

- 1) Section 46: Require a Class A operator for TOU tanks.
- 2) Section 46: Added requirements for Class C operators.
- 3) Section 46: Added operator documentation requirements.
- 4) Section 46: Clarified that operators cannot be a third party and must be an employee of the facility.
- 5) Section 46: Removed the daily inspection requirement for unattended stations, which is not required by EPA.
- 6) Section 46: Clarified that Class C operators must be trained onsite so they know the facility.
- 7) Sections 45, 46, 48: Changed licensing requirements from 3 years to 5 years. This is less burdensome on those affected by the licensing program.
- 8) Sections 45, 46, 47 and 48: Clarified that for license reciprocity, the licensee must have taken an exam because per statute passing an exam is required for licensing in Wyoming.

Not Substantive

1) Moved some sections/subsections to other Chapter Parts.

Part M

Substantive

1) The entire Part has been added and mirrors new EPA regulations 280.250 through 280.252. The Part addresses EPA previously deferred tanks: field-constructed tanks and airport hydrant fuel distribution systems. Note that DEQ is currently unaware of these tanks being located in Wyoming. However, if DEQ becomes aware of these types of tanks or they are installed in the future, these new regulations need to be in place. Additionally, these regulations need to be in place to satisfy EPA for continued grant funding.

Part N

Substantive

1) Additional requirement that tank owners and/or operators of 101 or more USTs who are eligible for the state corrective action account demonstrate financial responsibility for compensating third parties for bodily injury or property damage caused by accidental releases arising from the operation of petroleum USTs. The amount required is \$1 million dollars such that a total aggregate amount of \$2 million is reached when the financial responsibility of \$1 million provided by the state is applied.

Not Substantive

1) Chapter 19 (Financial Assurance) has been included as Part N to reduce the number of Chapters per the governor's initiative. Minor editorial changes were made to Part N

Appendix A

Not Substantive

1) Appendix A has been removed to reduce the number of pages. We have referenced the regulated substance list found in CERCLA pertaining to USTs rather than include the list in Appendix A. This list will also be contained in a guidance document maintained by the department.

The Council finds that these regulations are reasonable and necessary to accomplish the policy and purpose of the Act, as stated in W.S. 35-11-102, and that they have been promulgated in accordance with rulemaking provisions of the Wyoming Administrative Procedures Act.

Analysis of Comments Received During Public Comment Period for EQC Hearing

NOTE 1: Language that is both underlined and struck through was originally proposed by the Department and approved by the Water Waste Advisory Board. Based on EPA review, that language has been determined to be less stringent than federal requirements or requires additional clarification. Therefore, the language has subsequently been removed.

NOTE 2: Language that is double underlined has been added based on comments received during the March 19-May 4 public comment period.

NOTE 3: Bold, struck through text has been removed based on comments received during the March 19-May 4 public comment period.

COMMENTS:

United States Environmental Protection Agency (EPA) Comments.

Received March 26, 2018 via Public Comment Input Manager

Comment 1 – Part C General Operating Requirements, Section 12 Compatibility, Wyoming needs to add all compatibility requirements for any substances identified by the agency (and not just for fuels above E10 and B20). Section 12 (b) and (c)(i)(b) refers to "biofuel blends" to be stored. This must include other substances as identified by the implementing agency. Wyoming should consider listing a specific set of components that compatibility must be demonstrated instead of stating "all" in Section (c)(i) unless "all" refers to the items spelled out on the checklist and then they need to at least reference the checklist. "All" may be difficult to accomplish.

Response – The department agrees. The following rule revisions are proposed for Section 12(b). The Section 12(c) heading will be removed and requirements in Section 12(c) will become requirements under Section 12(b).

(b) Owners and/or operators shall notify the department at least 30 days prior to changing to a regulated substance containing greater than 10 percent ethanol, or greater than 20 percent biodiesel, or any other STP-regulated substance identified by the department. In addition, owners and/or operators shall meet the following:

(c) Biofuel Blends.

- (i) Prior to storing a biofuel blend these substances in an existing or new tank system, owners and/or operators shall demonstrate that all storage tank system components are compatible with the biofuel blend substance to be stored. Compatibility demonstration shall be made by one of the following:
- (B) Equipment or component manufacturer certification that the tank system components are compatible for use with the biofuel blend substance to be stored. This certification shall be in writing, indicating an affirmative statement of compatibility, including the biofuel blend range (if applicable), for which the component is compatible.
- (ii) Compatibility Checklist. The storage tank owner and/or operator shall complete the compatibility checklist developed by the department. The completed checklist and compatibility demonstration for each component of the tank system shall be submitted to the department. The department will issue written authorization to store the substance biofuel blend after review and acceptance of the submittal.

Comment 2 - Part D UST Systems: Release Detection, Section 14(g)(i)(B). Wyoming categorically allows sump sensors in lieu of conventional ALLD if sensors can detect 3 gallons of liquid in the sump regardless of sump size or shape. This does not meet the requirements for detecting a release within an hour. Unless a site specific analysis of sump sensors as stand-alone methods is completed it cannot be proven to meet requirements in all cases. Recommend addressing this on a site by site basis.

Response – The department agrees. The following rule revisions are proposed for Sections13(g)(iii)(C) and 14(g)(i)(B). Section 14(i) will be removed, and Section 14(j) will become Section 14(i).

[Section 13(g)(iii)(C)]

(C) <u>Function test sump sensors to demonstrate that they meet the requirements of Section 14(g)</u> <u>Wwhen sump sensors are used to meet the requirement for an Aautomatic Lline Lleak Ddetector.</u>, they shall be configured to meet the requirements of Section 14(g) and the annual inspection shall include a manual tripping of each sump sensor. The automatic device used to monitor sump sensors shall be triggered by the manual tripping of the sensors, and a A record shall be made showing the date when the test was done, the facility number, and recording the fact whether or not that the sensor operated as required. After the sump sensors have been function tested, they shall be placed in the sump at a location that allows the detection of 3 gallons of liquid if the sensor is being used as an automatic line leak detector. If the sensor is used solely for interstitial monitoring, t The sensor shall be placed in accordance with Section 14(h)(v).

[Section 14(g)(i)(B)]

(B) Be equipped with an automatic line leak detector, in accordance with the following: Automatic line leak detector Mmethods, including sump sensors which that alert the owner and/or operator to the presence of a leak by restricting or shutting off the flow of regulated substances through piping or triggering an audible or visual alarm, may be used only if they detect leaks of three (3) gallons per hour at ten (10) pounds per square inch line pressure within one (1) hour. If sump sensors are used as an automatic line leak detector, the sensor shall be placed in the sump such that it can detect 3 gallons of liquid in the sump regardless of the sump size or shape, and whether or not the sump is level. If sump sensors cannot detect 3 gallons of liquid, the sensors shall be relocated in the sump such that 3 gallons of liquid can be detected or another type of automatic line leak detector shall be installed. An annual test of the operation of the leak detector shall be conducted. Manufacturers are required to recommend procedures to be used for testing their own equipment, but all automatic line leak detectors shall be tested annually. No manufacturer shall recommend that its equipment not be tested nor interfere with the testing of its equipment in any way. In addition, all underground pressurized piping shall:

[Section 14(i) is removed]

(i) Piping Installed After June 30, 2017. When a new piping interstitial monitoring system is installed and sump sensors are used as standalone automatic line leak detectors, the system shall be configured to shut off the flow of product in that piping run when a sump sensor triggers an alarm. Essential homeland security systems, emergency generator systems, and systems used for other disaster relief efforts are exempt from this requirement.

[Section 14(j) becomes Section 14(i)]

systems using sumps for interstitial monitoring were installed before December 1, 2005, the owner and/or operator may install mechanical or electronic line leak detectors and perform annual line tightness testing in accordance with Section 14(g)(i)(B)(I) or an alternative tank leak detection method as described in Section 14(g)(i)(B)(II) to meet leak detection requirements. In this case, the owner and/or operator will not be required to perform periodic integrity testing of containment sumps used for interstitial monitoring.

Comment 3 - Article 14, Storage Tank Act of 2007, 35-11-1415. Definitions. (a)(ix)(F). Federal regulations do not exclude oil/water separators from the definition of an UST. Wyoming must regulate the same universe as the federal regulations to obtain SPA.

Response – The department agrees and will request a statute change during the 2019 legislative session.

Comment 4 - Does Wyoming require all tanks to have Cathodic Protection(CP)? If not, we suggest adding language at 280.11(3)(b) that requires a determination by a CP expert for USTs installed without CP.

Response - Yes; Wyoming requires all steel tanks to have cathodic protection. To clarify this requirement, the department proposes to revise Section 6(a)(ii):

(ii) Cathodically Pprotected Steel USTs shall be cathodically protected or isolated from ground contact and manufactured and installed to meet the following requirements:

Comment 5 - Part M, Section 50 (a)(i). Wyoming is using the federal dates which is acceptable. Wyoming may wish to ensure this is what they want to do.

Response - Wyoming does not have primacy for the program; therefore, the federal dates are being used. No change proposed due to comment.

Comment 6 – [Section] 13(d) Implementation dates for both 30 day and annual inspections don't seem to be included. These requirements appear to be immediate as written. This is fine, however Wyoming may want to consider other dates.

Response - Wyoming does not have primacy for the program; therefore, the federal rules are in effect. No change proposed due to comment.

Comment 7 - Section 13 (c) (viii) requires documentation of Class C operator training, We suggest adding language here that requires owners and operators to maintain documentation of Class A/B/C operator training. Add reference to sections 46(h) at a minimum. This needs to be referenced here and not just in the operator training section.

Response – The department agrees, and proposes the following change to Section 13(c)(viii):

(viii) Documentation of Class C Operator training. Documentation for all operator licensing and training as referenced in Section 46(h).

Comment 8 - Section 13 (c) - Does not specify how records are to be kept.

Response - Availability and records maintenance are addressed in Section 13(i). No change proposed due to comment.

Comment 9 - We suggest adding where records are to be maintained.

Response - Availability and records maintenance are addressed Section 13(i). No change proposed due to comment.

Comment 10 - Section 10(d)(iii) – Is Section 18 the correct reference here?

Response - Yes; Section 18 refers to record maintenance requirements in Section 13. Section 18 includes additional requirements. No change proposed due to comment.

Comment 11 - 13(c) (iii) - Should this be Section 13?

Response - No. Section 13(c)(iii) refers to documentation for system compatibility. System compatibility is addressed in Section 12. No change proposed due to comment.

Comment 12 - 13(c) & 10 – Add how long records of walkthrough inspections must be maintained.

Response - Section 13(f) requires records to be maintained for 12 months. No change proposed due to comment.

Comment 13 - Wyoming allows petroleum UST systems with a throughput less than 15k gallons per month to use inventory control as the sole leak detection method and restricts the use of SIR on UST systems greater than 500k gals. Additional methods like tracers and passive acoustic methods are considered equivalent to inventory control for monthly monitoring. In addition to allowing inventory control for 15k gallons per month UST systems, we suggest requiring a tightness test.

Response – The department believes the requirements in Section 14(f) are as protective as other leak detection methods including tightness testing. Federal law allows states the flexibility to determine alternate methods that are as protective as the federal rule. No change proposed due to comment.

Comment 14 - Sections 20 and 21. Splits the requirements into those with and without fund coverage. Wording issue: What is Wyoming's definition for "leak"? Action required only if tests results show a "leak" exists. Ensure this action is required in the case of a release to the environment. Ensure a release is a leak.

Response – The department agrees that a leak is a release because EPA has changed federal language from leak to release. "Leak" will be changed to "release" in every appropriate instance it occurs in the rule.

Comment 15 – [Sections] 20 and 21 differ in that site check and further action in [Section] 20 is required by the state. [Section] 21 directs owner to follow corrective action; [Section] 20 leaves it to the state. We cannot determine if this is acceptable under 281 – need additional information on how the state runs the corrective action sites where state is the lead.

Response - The department may put a new release into a project to be completed by one of the department's contracted engineering firms. The engineer will then complete a subsurface investigation, which is the "site check." Conversely, the department may complete the investigation (site check) using an "Investigation, Confirmation, and Mitigation (ICM) work orders. The department follows Storage Tank Program Guidance Document #11 (Immediate Response) procedures. No change proposed due to comment.

Comment 16 - Section 25 – Owners and Operators (O/O) are eligible for State Corrective Action Account–regulations are very broad and not as detailed as federal regulations – How does Wyoming ensure they meet all of 281 for fund led sites.

Response - The fund was originally approved by EPA as a mechanism to pay for cleanup of contaminated sites. When the state legislature set up the fund in the late 1980's in response to the federal law requiring owners/operators to cleanup sites, the state recognized the negative impact federal law could have on small operators in rural Wyoming. In some instances, the federal law could have put small operators out of business; leaving rural residents without fuel. The fund has been operating as the cleanup mechanism since 1990 without any issues. The Corrective Action Account is funded by a mineral severance offset equal to 1 cent per gallon of gasoline or diesel sold. The fund goes through an annual "fund soundness" review by EPA. No change proposed due to comment.

Comment 17 - Overarching issue on cleanup program - State does not write regulations for themselves on the sites they are the lead on. This may be ok under 281 but we cannot determine if it is based on the regulations. We need additional information on the state's policies and procedures for the state lead sites to determine if they meet the requirements of 281.

Response – The department follows the rule when completing cleanup. When a release is confirmed, the department puts the site into a project, selects three prequalified engineering firms that have an "As-Needed Engineering Services Contract" with the department to submit a proposal, and selects an engineer. The department issues a Task Order under the contract, and the engineer begins work. Work includes an investigation of the extent of contamination, selection and design of the remedial alternative, implementation of the remedial alternative, operation and maintenance (including monitoring) of the remedial alternative as appropriate, and site closure when cleanup objectives have been met. MCLs in groundwater must be reached to obtain closure. If the department closes a site and contamination is later found that could have been caused by eligible tanks, the department reopens the site and begins more work. The department does not issue "no further action" letters. This process has been used since program inception in 1990. The department has closed (closure objectives met including reaching MCLs in groundwater) over 1600 sites using this process. No change proposed due to comment.

Comment 18 - Section 24 and 25 - If a site is eligible for a release, the state will take on the investigation and mitigation of any immediate threats. The O/O is responsible for system repairs and stopping any further release. State will conduct the site check and then the state will prioritize the site for cleanup after initial abatement procedures. The ranking system for prioritization considers free product (present or likelihood). Part J lists Environmental remediation standards for leaking storage tanks. It has a section for free product stating that for free product more than 0.05 thick, restoration should begin as soon as possible. Section 24 is similar to federal requirements and is not similar or missing for Sections 25 for state led sites. Section 25 - O/O Eligible for State Corrective Action Account - says "Site Characterization and Corrective Action. The department will prioritize the site pursuant to Section 27 after completion of initial abatement measures. No other details are provided such as free product removal requirements for state as required for non-fund eligible sites. O/Os outside the state corrective action program are required to investigate and begin free product removal as soon as practicable.

Policy question for the state: What is the state timing requirement for sites under the state corrective action program with free product?

Response – The department follows the rule when completing cleanups. The department will contract with an engineer as soon as possible and the engineer will begin work to remove free product as soon as possible. The department may also begin work immediately using the Investigation, Confirmation, Mitigation (ICM) work order mechanism. The department follows Storage Tank Program Guidance Document #11 (Immediate Response). No change proposed due to comments.

Comment 19 - The Fund cleanup regulations only say: The department will prioritize the site pursuant to Section 27 after completion of initial abatement measures. The department will also collect sufficient data for classification of the affected groundwater under Chapter 8, Wyoming Water Quality Rules and Regulations.

Response - True. See response to Comment 21 below. Wyoming no longer has a backlog of sites not being addressed due to lack of resources. Sites are now put into a project within 3 months of release regardless of priority. Department policy is to wait up to 3 months (action will be taken sooner to address immediate threat to human health or the environment) to select an engineer to begin work. No change proposed due to comment.

Comment 20 - Part E Section 25 (fund cleanups) does not reference the standards found in Part J?

Response - The statute indicates that rules will be developed that establish cleanup standards. Per statute, Part J lists the standards for all cleanups completed in the state whether done by the department or by the owner/operator. The department follows the rule when completing cleanups. No change proposed due to comment.

Comment 21 - Section 27 – This appears to determine priority order for cleanups for sites the state is the lead on. For sites where the O/O is the lead the cleanups must all move forward no matter what the priority order. What happens to low priority sites where the state is the lead? If these sites are not addressed in a timely manner that is not consistent with 281 and the state cannot receive SPA.

Response - When the program began in 1990, there were 475 contaminated sites that joined the program. The state did not have personnel or funds to address all sites at once, and a priority ranking system was developed. Wyoming no longer has a backlog of sites not being addressed due to lack of resources. Sites are now put into a project within 3 months of release regardless of priority. Department policy is to wait up to 3 months (action will be taken sooner to address immediate threat to human health or the environment) to select an engineer to begin work. It is more cost effective to combine several sites into one project rather than working on one site at a time. Therefore, to reduce costs to Wyoming taxpayers and limit liability on the fund, the program completes up to three sites at a time if the sites are in the same geographical location. As documented in the FY2017 EPA fund soundness review, the department had 17 new releases during the fiscal year, and 17 new releases were put into a project during the fiscal year. No change proposed due to comment.

Comment 22 - Section 24(f) - Part J lists standards required for remediation of soil and groundwater. Section 24 is similar to federal requirements and is not similar or missing for Sections 25 for state led sites. In Part J, there is a reference to eligible tank systems and eligible constituents. What does the term eligible refer to?

Response - Eligible constituents are the same as those requiring to be addressed under the federal law and include gasoline, diesel, biodiesel, ethanol blends, and hazardous substances defined in section 101(14) of CERCLA. The department proposes to develop a Guidance Document listing the eligible constituents. As part of the Governor's initiative to reduce the number of pages in rule, Appendix A has been removed the rule. Appendix A listed the eligible constituents, which will now move to a Guidance Document.

Comment 23 - How does the state ensure there is a corrective action plan for fund led sites?

Response - The template scope of work provided to the engineer under contract to complete the work includes submittal of a Remedial Action Plan (RAP), or Corrective Action Plan. The RAP is reviewed by the STP Project Manager to ensure it complies with the requirements of the Scope of Work. The project manager works with the engineer to ensure the remedial approach identified by the engineer is appropriate and the best available technology for cost-effective site cleanup. "Fund led sites" are completed by the department's contracted engineer. The STP project manager is involved in every step of the cleanup at every site. The STP project manager oversees the work being completed by the engineer under contract by the department. No change proposed due to comment.

Comment 24 - Section 31(b) states that owners must perform site assessment as defined in section 29. Does this mean that [Section] 20(a) is not considered here because you already know a site assessment is required? To make this clear we suggest you reference exactly which part of 29 you are referring to.

Response - A minimum site assessment (MSA) as required by Section 29 constitutes the site assessment. The MSA provides data to determine whether or not the site is contaminated when the tanks are closed. A system test is not needed to determine if the site is contaminated. A system test is not needed to close the tank. All of Section 29 applies. No change proposed due to comments.

Comment 25 - Section 53. FR Amount and Scope. This section applies to petroleum USTs or contaminated site owners and/or operators not eligible for the state corrective action account. Do Wyoming regulations or statutes require the Corrective Action Fund to meet requirements of 281 – such as \$1 million in coverage, etc? Need additional information on what the fund covers in order to determine if Wyoming's FR meets 281.

Response - The Financial Responsibility Account (FRA) has a dedicated \$1 million balance. Because the majority of sites in Wyoming are covered by the Corrective Action Account (CAA) for cleanup and Wyoming pays to cleanup affected third-party sites, the FRA has never been used since it was created by the legislature in 1990. The CAA pays for cleanup of source sites and third party sites. This mechanism was approved by EPA when the program was established. No change proposed due to comment.

Comment 26 - Section 46. Storage Tank Operator Licensing. Wyoming allows Class A and B operators 90 days to be trained. Recommend Wyoming add "testing and inspections" to the list of topics for the ICC Wyoming Exam required for Class A and B operators. This will ensure new state requirements such as spill, overfill, and containment sumps for piping interstitial monitoring testing, release detection equipment testing, and walkthrough inspections are covered.

Response - The Exam will be revised after the new regulations have been adopted. No rule change proposed due to comment.

Comment 27 - Part A, Section 4 does not address previously deferred EGTs. Were emergency generator tanks always required to have release detection? If not, please update the applicability section to reflect the new requirement. Release detection is required for emergency generators.

Response – Yes; emergency generator tanks (EGTs) were always required to have release detection. No change proposed due to comment.

Comment 28 - Wyoming does not include the federal definitions listed below in its regulations; however, at Sec. 5 introductory paragraph, the State makes it clear that definitions in 40 CFR Part 280.12 apply for those terms not defined in the State's regulations. At Sec. 2(c)(iv)(G), the State specifies July 1, 2016, as the incorporation by reference date of provisions from 40 CFR Part 280. 280.12 definitions not in Wyoming regulations but covered under Incorporated By Reference (IBR) at Sec. 2(c)(iv)(G) and Sec. 5 intro.: Beneath the surface of the ground, Cathodic protection, Cathodic protection tester, Consumptive use, Dielectric material, Dispenser, Dispenser system, Electrical equipment, Excavation zone, Existing tank system, Farm tank, Flow-through process tank, Free product, Gathering lines, Liquid trap, Motor fuel, New tank system, Noncommercial purposes, On the premises where stored, Person, Petroleum UST system, Pipe or piping, Pipeline facilities (including gathering lines), Release detection, Residential tank, SARA, Secondary containment or secondarily contained, Septic tank, Storm water or wastewater collection system, Surface impoundment, Tank, Under-dispenser containment or UDC, Underground area, Underground release

Response - Section 5 states that the definitions in the rule supplement those found in statute and the CFR. Not all definitions were included in an effort to reduce the number of pages in the rule per the Governor's initiative. Only definitions that are routinely used are included in the rule. No change proposed due to comment.

Comment 29 - If possible, please add the language found in 280.34(b)(1).

Response - The department does not allow steel tanks to be installed without cathodic protection. Therefore, 280.34(b)(1) is not applicable. No change proposed due to comment with the exception of clarification made to Section 6(a)(ii) under Comment 4 above.

Comment 30 - Section 61. Release from the Requirements. In 2015, EPA replaced "properly closed" with "permanently closed or undergoes a change-in-service." Recommend Wyoming match federal revision.

Response – The department agrees. Proposed change to Section 61:

Section 61. Release from the Requirements. An owner and/or operator is no longer required to maintain financial responsibility under this Part for a UST after the tank has been properly closed permanently closed or undergoes a change-in-service or, if corrective action is required, after corrective action has been completed and the tank has been properly closed in accordance with Part G.

Comment 31 - Section 62. Bankruptcy or other incapacity of owner and/or operator or FA guarantor. This section only discusses what guarantor needs to do if guarantor is named in a Title 11 proceeding. Section 62. The title of this section might be inaccurate. The section seems to only deal with the bankruptcy of the FA guarantor. The rest of the title isn't addressed (i.e., there is no other incapacity and doesn't talk about bankruptcy or other incapacity of O/O). Wyoming may wish to consider revising.

Response - The fund mechanism (Corrective Action Account) used in Wyoming to cleanup both source sites and third-party sites adequately addresses this issue. Bankruptcy or other incapacity of the owner and/or operator is not an issue because the department will continue to cleanup the site using the Corrective Action Account. The FA guarantor is the State of Wyoming. Section 62 in the federal regulations is not applicable in Wyoming. No changes proposed due to comment.

Comment 32 - Wyoming does not require facilities that are ineligible for the CAA to immediately investigate and confirm releases onsite.

Response - The department does require facilities ineligible for the CAA to immediately investigate and confirm a release; see Section 21. No change proposed due to comment.

Comment 33 - Wyoming does not have an analog to this federal provision [280.110] requiring notification of current evidence of financial responsibility within 30 days after identification of a reportable release from a UST.

Response - Owner/operators do not use the mechanisms referenced in 280.110; they use the state fund. If the owner/operator has paid fees, they are covered by the state fund. The department tracks fee payment, issues late fee invoices, and red tags (delivery prohibition) facilities that do not pay fees. The department will complete cleanup at facilities that do not pay fees and seek cost recovery. Fees are only \$200 per tank; average cleanup costs are over \$500,000. Facilities typically pay their fees when faced with delivery prohibition and cost recovery. No change proposed due to comment.

Comment 34 - The state provision indicates Class A and Class B operator operators must obtain a license (the state's corollary for the federal training requirements) within 90 days of employment with a UST company. The federal requirement is limited to "within 30 days of assuming duties."

Response – The department agrees and proposed the following change to Section 46(c):

(c) Timing. Within ninety (90) 30 days of assuming duties, the first date of employment with the company, the Class A and Class B o perators shall obtain a Class A or B Storage Tank Operator's license from the department. To obtain this license, the operator(s) each person shall submit documentary evidence that he or she has passed the following tests within the five (5) years preceding the application date:

Comment 35 - The federal retraining provision at 280.244 requires Class A and B operators at facilities out of compliance to be retrained within 30 days of the determination of non-compliance. While the state has the leeway to waive the retraining under 280.244(a) where annual refresher training is demonstrated, or 280.244(b) at the agency's discretion, the program must make these requirements and exceptions explicit. The Wyoming regulations with respect to Class A operators do not require retraining for this class of operators at all. The state's retraining with respect to Class B operators allows the retraining to be completed within 90 days of the notice of violation, instead of the federal 30-day limit. This may be acceptable if the state intends for the Class B operators to have annual refresher training. The state may wish to consider demonstrating their intent with respect to this aspect of the retraining provisions.

Response – The department agrees that the Class B operator should be retrained within 30 days. The department intends to waive retraining for the Class A operator as allowed by 280.244(b). The following changes are proposed for Sections 46(i) and 44(a)(xvii)

Section 46(i):

(mi) Retraining Required. When a Notice of Violation and Order is issued to a facility for any of the reasons listed in Section 44(a)(i) through (xxiixviii), the Class B Operator must shall be retrained. Retraining shall be in the form of retaking (if previously taken) or taking (if not previously taken) and passing the "Wyoming State Specific Storage Tank Laws – ICC Test W-6" exam. The Class B Operator shall take this test within ninety (90) and days of the Notice of Violation date. If there is more than one Class B Operator for the facility, at a minimum one of the Class B Operators must shall take the exam.

Section 44(a)(xvii):

(xvii) The department becomes aware that there has been no <u>Licensed Class A or B</u> Operator for a facility for ninety (90) days or more; or the Class B Operator has not been retrained per Section 46(i) within 90 days of a Notice of Violation being issued;

Comment 36 - Wyoming does not have analogs to 40 CFR 280.245(b)(1) - (3) requiring certain types of records be kept with respect to the training of facility operators of all classes. The state may wish to incorporate these provisions regarding training documentation.

Response – The department does require record documentation in Section 46(h). No change proposed due to comment.

Chapter 17 Storage Tanks

Repealed

CHAPTER XIX

Financial Assurance for Underground Storage Tanks Repealed

Chapter 17 Storage Tanks

Repealed

Part A

STORAGE TANK SYSTEMS: INTRODUCTION

Section 1. Authority. These standards are promulgated
pursuant to the Wyoming Environmental Quality Act Statutes 35-11
101 through 35 11 1802, specifically, but not limited to, Wyomin
Statutes 35 11 302, and 35 11 1414 through 35 11 1428.
Section 2. Codes and standards referenced in this
Chapter. There are a number of places within this chapter wher
codes and standards are referenced. There are also references t
regulations issued by other agencies. The following apply to al
such references in this chapter:
such references in this chapter.
(a) In all cases, the referenced codes, standards and
regulations are lengthy documents in and of themselves.
Inserting the entire text of these documents into this chapter
would be unduly cumbersome and expensive;
(b) The references to these codes, standards and
regulations in this Chapter fully identifies the material by
title, facility, or statutory reference. All such referenced
materials are incorporated as they stand on the day that this
chapter is adopted into law, and any later amendments or edition
are specifically not incorporated into this chapter;
(c) The department has obtained a complete copy of the
current edition of every code, standard, or regulation reference
in this chapter and placed them in the Wyoming State Library.
These materials can be checked out either directly from the Stat
Library or through interlibrary loan from any Wyoming library
which is part of that system;
- -
(d) Each code, standard, or regulation referenced in this

chapter is published independently and is available from the publisher. The name, address and contact information for all such publishers is contained in the definition section of this

chapter. Copies may be obtained from the publisher;
(e) Copies of the codes, standards, or regulations referenced in this chapter are also available at cost by contacting the Storage Tank Program, 122 West 25 th Street, Cheyenne, WY 82002.
Section 3. Purpose. The purpose of these rules and regulations is to:
(a) Establish a storage tank leak prevention program to prevent releases and to minimize health hazards and environmental damage should a release occur;
(b) Allow Wyoming to assume primacy of the U.S. Environmental Protection Agency (EPA) underground storage tank (UST) program;
(c) Establish priorities for cleaning up releases from storage tank systems; and
(d) Establish a procedure to determine environmental restoration standards.
Section 4. Applicability. The requirements of this chapter apply to all owners and/or operators of storage tank systems as de0fined in W.S. 35 11 1415; except that Parts B, C, D, E, and C of this chapter do not apply for any of the following types of UST systems:
(a) Wastewater treatment tank systems;
(b) Any UST system containing radioactive materials that are regulated under the Atomic Energy Act of 1954, as amended (42 U.S.C. 2011 and following);
(c) Any UST system that is part of an emergency generator system at nuclear power generation facilities regulated by the Nuclear Regulatory Commission under 10 CFR Part 50, Appendix A;
(d) Airport hydrant fuel distribution systems; and
(e) UST systems with field constructed tanks.

- Section 5. Definitions. The following definitions supplement those found in W.S. 35 11 103, the "Environmental Quality Act, and W.S. 35 11 1415, the "Storage Tank Act of 2007."

 (a) "Above ground release" means any release to the surf
- (a) "Above ground release" means any release to the surface of the land or to surface water. This includes, but is not limited to, releases from the above ground portion of any regulated storage tank system and above ground releases associated with overfills and transfer operations as the regulated substance moves to or from any regulated storage tank system.
- (b) "ALLD" means an automatic line leak detector. This is a device that either restricts the flow through a line or sounds an audible or visible alarm if the connected piping has a leak in it.
- (c) "ANSI" means the American National Standards Institute 25 West 43rd Street, Forth Floor, New York, NY 10036, telephone: (212) 642-4900.
- (d) "API" means the American Petroleum Institute, 1220 L Street NW, Washington, DC 20005, telephone: (202)682-8000.
- (e) "AST" means an above ground storage tank as defined by W.S. 35 11 1415(a)(xi) which is used by a fuel dealer to dispense gasoline or diesel to the public.
- (f) "AST System" means the above ground storage tank
 and all connected piping.
- (g) "ASTM" means the American Society for Testing and Materials, 100 Barr Harbor Drive, P.O. Box C700, West Conshohocken, PA 19428 2959 (610) 832 9585, (610) 832 9555 (FAX).
- (h) "Ancillary equipment" means any devices including, but not limited to such devices as piping, fittings, flanges, valves, and pumps, used to distribute, meter, or control the flow of regulated substances to and from a storage tank.
- (i) "Below ground release" means any release to the subsurface of the land and to groundwater. This includes, but is not limited to, releases from the below ground portions of a storage tank system and below ground releases associated with

overfills and transfer operations as the regulated substance moves to or from a storage tank.

- (j) "Biodiesel" means a fuel composed of mono-alkyl esters of long fatty chain acids derived from vegetable oils or animal fats, meeting the requirements of ASTM specification D6751. "Biodiesel" is interchangeable with Diesel for all purposes of this chapter.
- (k) "CAP" means a "corrective action plan" designed to restore a site contaminated by regulated substances from a storage tank release to a condition which is protective of the public health and safety and consistent with published standards found in this chapter.
- (1) "CP" means cathodic protection which is a technique to prevent corrosion of a metal surface by making that surface the cathode of an electrochemical cell. CP may be provided by either galvanic anodes or impressed current.
- (m) "CP tester" means a person who can demonstrate an understanding of the principles and measurements of all common types of CP systems as applied to buried or submerged metal piping and tank systems. At a minimum, such persons shall have education and experience in soil resistivity, stray current, structure to soil potential, and component electrical isolation measurements of buried metal piping and storage tank systems.
- (n) "CERCLA" means the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended.
- (o) "Compatible" means the ability of two (2) or more substances to maintain their respective physical and chemical properties upon contact with one another for the design life of the tank system under conditions likely to be encountered in the storage tank system.
- (p) "Connected piping" means all underground piping including valves, elbows, joints, unions, flanges, and flexible connectors attached to a storage tank system through which regulated substances flow and which routinely contains the regulated substance. The piping that joins two (2) storage tank systems should be allocated equally between them for purposes of determining how much piping is connected to any individual storage tank system.

- (q) "Contaminated Site" means a site at which releases from storage tank systems have resulted in concentrations of regulated substances in environmental media which exceed criteria for the protection of human health or the environment.
- (r) "Corrosion expert" means a person who, by reason of thorough knowledge of the physical sciences and the principles of engineering and mathematics acquired by a professional education and related practical experience, is qualified to engage in the practice of corrosion control on buried or submerged metal piping systems and metal tanks. Such a person shall be accredited or certified as being qualified by the NACE or be a registered professional engineer who has certification or licensing that includes education and experience in corrosion control of buried or submerged metal piping systems and metal tanks.
- (s) "Dielectric material" means a material that does not conduct direct electrical current. Dielectric coatings are used to electrically isolate UST systems from the surrounding soils. Dielectric bushings are used to electrically isolate portions of the underground storage system from each other (e.g., tank from piping).
- (t) "Drinking water equivalent level or DWEL" means the maximum concentration of a contaminant established by the Wyoming Department of Environmental Quality, Water Quality Division, pursuant to this chapter or Chapter 8, Water Quality Rules and Regulations, Quality Standards for Wyoming Groundwaters, for which no known or anticipated adverse effects on human health will occur.
- (u) "Ethanol" means an alcohol derived from the fermentation of sugar, grain, or other biomass and used as fuel for internal combustion engines. Ethanol is usually denatured using gasoline, petroleum condensate, or some other petroleum prior to being marketed for fuel. For purposes of this chapter, "Ethanol" will be treated interchangeably with "gasoline."
- (v) "Emergency" means a situation where replacement or retrofit of ancillary equipment to an existing storage tank system because of a sudden release or existing ancillary equipment failure is essential to continued operation of any facility and the owner and/or operator can easily and quickly replace or retrofit the equipment to remain in operation.

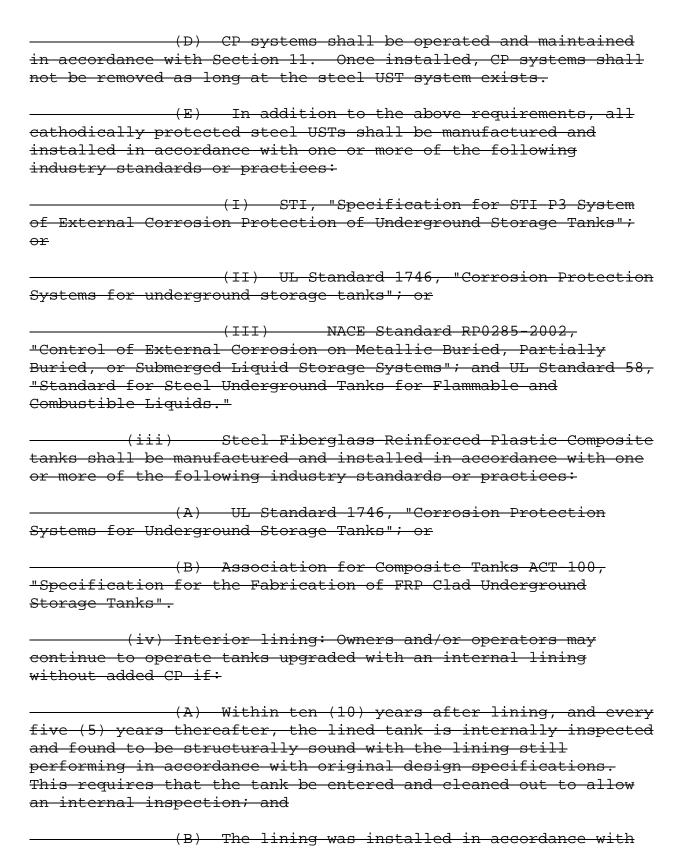

- (w) "Excavation zone" means the volume containing the tank
 system and backfill material bounded by the ground surface,
 walls, and floor of the pit and trenches into which the UST
 system is placed at the time of installation.
- (x) "Free product" means a regulated substance that is
 present as a nonaqueous phase liquid (e.g., liquid not dissolved
 in water).
- (y) "Hazardous substance UST system" means an UST system that contains a hazardous substance listed in Appendix A of this chapter, (but not including any substance regulated as a hazardous waste under Subtitle C of the Resource conservation and Recovery Act of 1984) or any mixture of such substances and petroleum, and which is not a petroleum UST system.
- (z) "Heating oil" means petroleum that is No. 1, No. 2, No. 4 light, No. 4 heavy, No. 5 light, No. 5 heavy, and No. 6 technical grades of fuel oil; other residual fuel oils (including Navy Special Fuel Oil and Bunker C); and other fuels when used as substitutes for one of these fuel oils. Heating oil is typically used in the operation of heating equipment, boilers, or furnaces.
- (aa) "Hydraulic lift tank" means a tank holding hydraulic fluid for a closed loop mechanical system that uses compressed air or hydraulic fluid to operate lifts, elevators, or other similar devices.
- (bb) "Licensed Operator" means a human being, employed by the "Operator," who is in responsible charge of the storage tanks at one or more locations. "Licensed Operator" refers to the holder of any of the licenses referred to in Section 46 of this chapter.
- (cc) "Maintenance" means the normal operational upkeep to
 prevent a storage tank system from releasing a regulated
 substance.
- (dd) "Maximum contaminant level or MCL" means the maximum allowed concentration of a contaminant established by the U.S. Environmental Protection Agency under the Safe Drinking Water Act and published in 40 CFR Part 141.

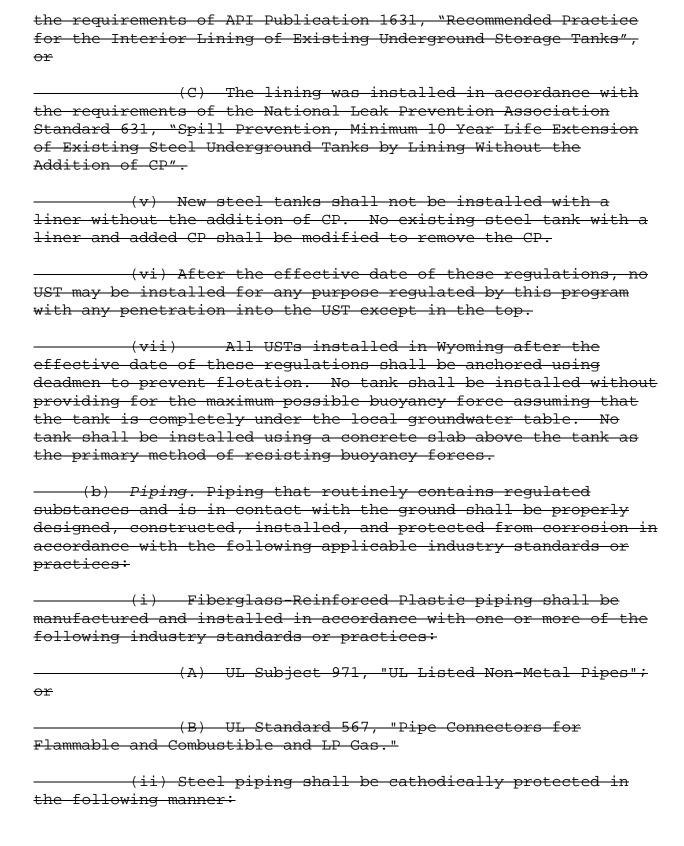

- (ee) "Minimum Site Assessment" or "MSA" means a limited subsurface investigation performed at a storage tank facility to determine whether a regulated substance has been released from a storage tank system(s) which has caused, or is causing, soil and/or ground water contamination that exceeds applicable standards.
- (ff) "NACE" means the National Association of Corrosion Engineers 1440 South Creek Drive, P.O. Box 201009, Houston, TX 77216 1009 telephone (281) 228 6200, FAX (281) 228 6300.
- (gg) "NFPA" means the National Fire Protection Association, Batterymarch Park, Quincy, MA 02269, telephone: (800)344-3555.
- (hh) "Operational life" means the period beginning when installation of the storage tank system has commenced until the time the storage tank system is properly closed under Part G.
- (ii) "Overfill release" means a release that occurs when a storage tank system is filled beyond its capacity resulting in a discharge of the regulated substance to the environment.
- (jj) "PEI" means the Petroleum Equipment Institute, P O Box 2380, Tulsa, OK 74101, telephone: (918)494-9696.
- (kk) "Pipe or piping" means a hollow cylinder or tubular conduit that is constructed of non earthen materials.
- (11) "RCRA" means the Resource Conservation and Recovery Act of 1984, as amended.
- (mm) "Repair" means to restore a tank or storage tank system
 component that has caused a release of a regulated substance from
 the storage tank system.
- (nn) "STI" means the Steel Tank Institute, 570 Oakwood Road, Lake Zurich, IL 60047, telephone: (847) 438-8265.
- (oo) "Statistical Inventory Reconciliation" or "SIR" means a method using statistics as well as simple inventory reconciliation to determine if a tank system is leaking. SIR providers must use a method which has been approved in writing for use in the UST program by the Environmental Protection Agency.

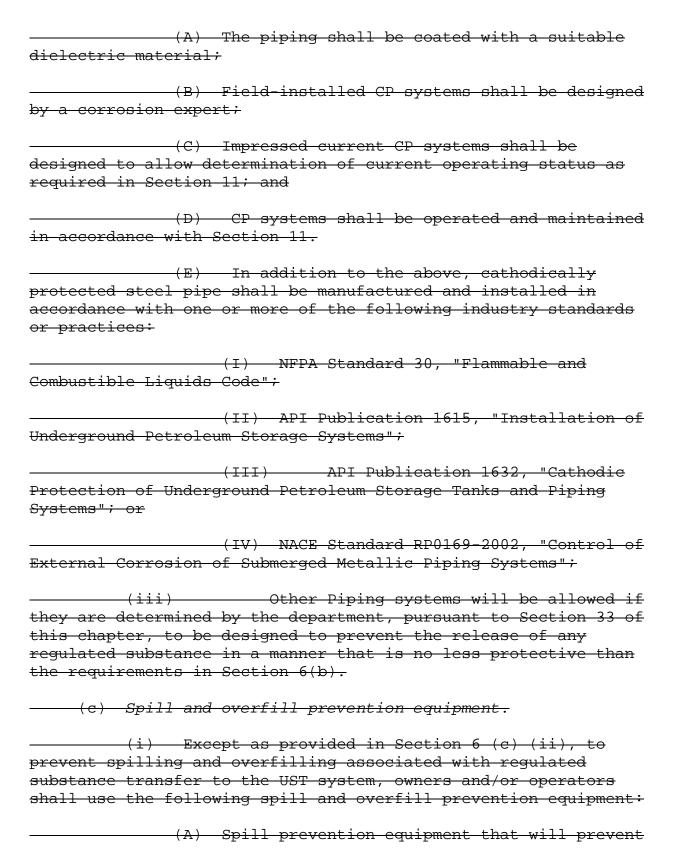

- (pp) "Storage Tank" means either a regulated above ground storage tank or an underground storage tank.
- (qq) "Substantial modification" means the addition or retrofit (not routine maintenance) of any fundamental portion of a storage tank system which would affect the daily operation of the storage tank system, including, but not limited to, CP, internal or external piping system(s), liners, leak detection equipment, spill and overfill controls, manhole installation, etc., to improve or upgrade the storage tank system. Substantial modifications also include the addition of canopies, new electrical conduits, and other items which may not be directly related to the storage tank system, but where the construction could adversely affect the storage tank system.
- (rr) "Upgrade" means the addition or retrofit of some systems such as CP, lining, spill and overfill controls, or secondary containment systems, to improve the ability of a storage tank system to prevent the release of a regulated substance.
- (ss) "UST" means underground storage tank.
- (tt) "UST system" means an underground storage tank,
 connected underground piping, underground ancillary equipment,
 and a containment system, if any.
- (uu) "UL" means the Underwriters Laboratories, Inc. , 333
 Pfingsten Road, Northbrook, IL 60062, telephone: (631) 271 6200.

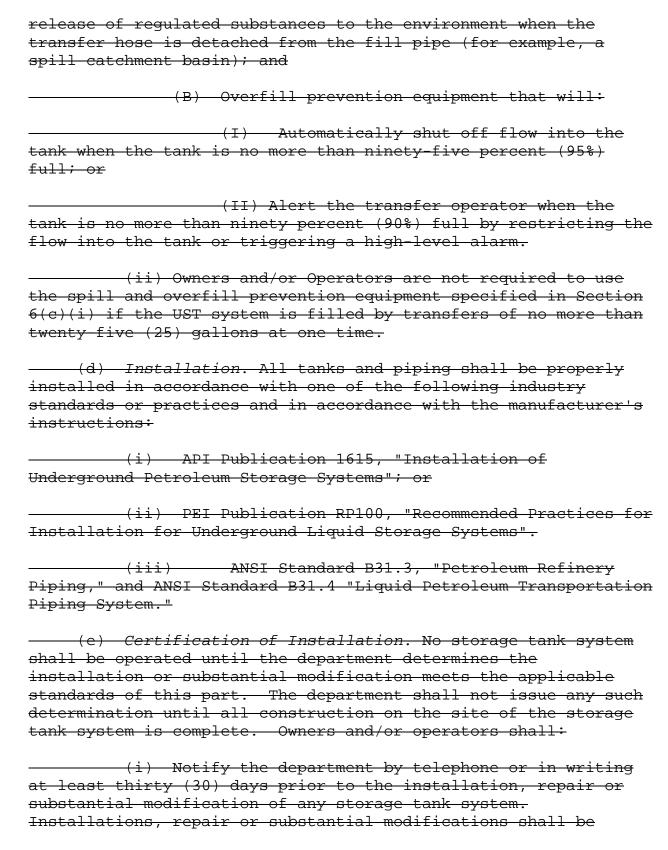

PART B

STORAGE TANK SYSTEMS: TECHNICAL SPECIFICATIONS Section 6. Design and Construction Standards for UST **Systems.** In order to prevent releases due to structural failure, corrosion, or spills and overfills for as long as the UST system is used to store regulated substances, all owners and/or operators of UST systems shall meet the following requirements. (a) Tanks. Each tank shall be properly designed, constructed, and installed, and any underground component that routinely contains regulated substances shall be protected from corrosion, in accordance with a code of practice developed by a nationally recognized association or independent testing laboratory as specified below: (i) Fiberglass Reinforced Plastic tanks shall be manufactured and installed in accordance with one or more of the following industry standards or practices: (A) UL Standard 1316, "Standard for Glass Fiber Reinforced Plastic underground storage tanks for Petroleum Products"; or (B) ASTM Standard D 4021 1992, "Standard Specification for Glass Fiber Reinforced Polyester underground storage tanks." (ii) Cathodically Protected Steel USTs shall be manufactured and installed to meet the following requirements: (A) The outside surface of all steel tanks installed after the date of these regulations shall be coated with a suitable dielectric material; (B) Field-installed CP systems shall be designed by a corrosion expert; (C) Impressed current CP systems shall be designed to allow determination of current operating status as required in Section 11, including a voltage meter, an amperage meter, and an hour meter showing the hours that the rectifier actually operated; and

scheduled at mutually acceptable times so that the department can ensure a representative is on site at various phases of installation or substantial modification. Inspections shall be completed within ten (10) days of the date when the department is notified that the installation, repair or substantial modification is complete; and (ii) Pay the department a fee for each storage tank system or multiple storage tank systems installed, repaired or substantially modified at the same time and at the same site pursuant to W.S. 35 11 1420(c). The department will invoice the owner and/or operator upon completion of the final installation, repair or substantial modification inspection. The owner and/or operator shall remit payment to the department within thirty (30) days of receipt of the department's invoice; and (iii) Ensure that the installation or substantial modification of all USTs meets the performance standards of this part; and (iv) Obtain a certification from the installer, or person modifying the UST, certifying that the tank was installed or modified to meet the requirements of this part. Such certification shall be provided on the UST notification form required under Section 9; and (v) In the case of an emergency where the owner and/or operator cannot comply with the notification requirement of Section 6(e)(i), notify the department by telephone as soon as the emergency is found. Before proceeding with any substantial modification or installation: (A) The department shall determine whether an inspection can be made within the owner and/or operator's schedule of work; or (B) If the department cannot make the inspection, the owner and/or operator shall provide by mail, the specifications of materials and industry standards or practices used to accomplish the installation or substantial modification and documentation of any tests required within five (5) days of completion. Section 7. Substandard USTs. UST systems which do not

meet the standards of Section 6 shall not be placed back into

ground in accordance with Part G of this chapter. Section 8. Repairs Allowed. (a) Owners and/or operators of storage tank systems shall ensure that repairs will prevent releases due to structural failure or corrosion as long as the storage tank system is used to store regulated substances. The repairs shall meet the following requirements: (i) Repairs to UST systems shall be properly conducted in accordance with one or more of the following industry standards or practices: (A) NFPA Standard 30, "Flammable and Combustible Liquids Code"; (B) API Publication 2200, "Repairing Crude Oil, Liquified Gas, and Product Pipelines"; or (C) API Publication 1631, "Recommended Practice for the Interior Lining of Existing underground storage tanks"; (ii) Repairs to above ground storage tank systems shall be properly conducted in accordance with one or more of the following industry standards or practices: (A) NFPA Standard 30, "Flammable and Combustible Liquids Code"; (B) API Standard 620, "Design and Construction of Large, Welded Low Pressure Storage Tanks"; (C) API Standard 650, "Welded Steel Tank for Oil Storage"; (D) API Standard 653, "Tank Inspection, Repair, Alteration, and Reconstruction"; or (E) PEI Recommended Practice 200 2003, "Recommended Practices of Installation of Aboveground Storage Systems for Motor Vehicle Fueling".

service if they have been out of use for more than one year.
Substandard USTs shall be permanently closed or removed from the

(iii) Repairs to fiberglass-reinforced plastic USTs may be made by the manufacturer's authorized representatives or in accordance with a code of practice developed by a nationally recognized association or an independent testing laboratory. (iv) Pipe sections and fittings that have released regulated substances as a result of corrosion or other damage shall be replaced. (v) Repaired storage tank systems shall be tightness tested in accordance with Sections 14(f) and 16(b) within thirty (30) days following the date of the completion of the repair unless: (A) The repaired storage tank system is internally inspected in accordance with a code of practice listed in this section; or (B) The repaired portion of any UST system is monitored monthly for releases in accordance with a method specified in Section 16 (b) through (k); or (C) Another test method is used that is determined by the department, pursuant to Section 33, to be no less protective of human health and the environment than those listed above. (v) storage tank system owners and/or operators shall maintain records of each repair for the remaining operating life of the UST system that demonstrate compliance with the requirements of this section. (b) All owners and/or operators of repaired UST systems shall ensure the modifications meet the performance standards for design and repair, as set forth in Section 6. (c) Costs associated with remediation of any release from a storage tank system during tank installation or repair work by a tank installer, tester, owner and/or operator, etc., are not eligible for the state's corrective action account funds. (d) Any time steel connected piping is repaired or modified

by replacing the pipe with a non-corrodible pipe, all of the connected piping on that run shall be replaced. Any time steel

piping which is not cathodically protected is repaired or replaced, the entire run of pipe shall be replaced with a non-corrodible pipe.

PART C			
STORAGE TANK SYSTEMS: GENERAL OPERATING REQUIREMENTS			
Section 9. Notification Requirements.			
(a) New UST Systems. Any owner and/or operator who brings an underground storage tank system into use after May 8, 1986, shall, within thirty (30) days of bringing such tank into use, submit, on the form prescribed by the department, a notice of the existence of such tank system to the department.			
(b) Existing Storage Tank Systems. Owners and operators of an UST(s) that has been used to store regulated substances since January 1, 1974, and that was in the ground as of May 8, 1986, shall immediately submit, on the form prescribed by the department, a notice of the existence of such tank(s) to the department. Owners and/or operators of any AST that has been used to sell fuel to the public since July 1, 1994 shall immediately submit, on the form prescribed by the department, a notice of the existence of such tank(s) to the department. All storage tanks located at the same facility shall be registered under the same facility identification number.			
(c) Fees. Owners and/or operators of storage tank systems shall pay the annual fees specified by W.S. 35 11 1425 no later than January 1 of each year or thirty (30) days after the first invoice, whichever is the later date. Fees are not prorated, the fee is assessed based on a calendar year. Fees begin on the date when the tank is first filled with a regulated substance and end on the date when the tank is placed permanently out of service or converted to a non-regulated use under these regulations.			
(d) Certification. All owners and/or operators of new UST systems shall certify on the notification form conformance with the following requirements:			
$\frac{\text{(i)} \text{Installation of tanks and piping under Section}}{6\text{(d)};}$			
(ii) CP of steel tanks and piping under Section 6(a) and (b);			
(iii) Financial responsibility under Chapter 19,			

Water Quality Rules and Regulations, UST Program Financial

Responsibility: (iv) Release detection under Sections 14 through 17; and (v) Overfill and spill prevention under Section 6(c). (e) Installer Certification. All owners and/or operators of new UST systems shall ensure that the installer certifies on the notification form that the methods used to install the tanks and

piping complies with the requirements in Section 6(d).

- (f) Requirements for sellers. After the effective date of these regulations, any person who sells a tank intended to be used as a regulated storage tank, and any person who transfers an existing storage tank system shall notify the purchaser of such tank of the owner's notification obligations in accordance with this section. After the effective date of these regulations, any person who sells a contaminated site shall notify the purchaser that the site is a contaminated site subject to requirements of this chapter.
- (g) Transfer of Control. Prior to the transfer of control of a storage tank system to a different owner and/or operator, notification of the transfer shall be provided to the department pursuant to W.S. 35 11 1420(a). Such notifications shall be provided on a form developed and provided by the department.

Section 10. Spill and Overfill Control.

- (a) Owners and/or operators of storage tank systems shall ensure that releases due to spilling or overfilling do not occur. The owner and/or operator shall ensure that the volume available in the tank is greater than the volume of regulated substance to be transferred to the tank before the transfer is made. The owner and/or operator shall also insure that the transfer operation is monitored constantly to prevent overfilling and spilling.
- (b) Owners and/or operators shall report, investigate, and clean up any spills and overfills in accordance with Section 22.
- (c) Surface spills that occur at a storage tank facility during the transfer of a regulated substance to the tank are required to be reported and cleaned up by any person owning or

having controlled the regulated substance pursuant to Section 22(a) of this Chapter, and Chapter 4, Water Quality Rules and Regulations.

Section 11. Operation and Maintenance of Corrosion

Protection (CP). All owners and/or operators of steel storage
tank systems with CP shall comply with the following requirements
to ensure that releases due to corrosion are prevented for as
long as the storage tank system is used to store regulated
substances:

- (a) Continuous Operation. All CP systems shall be operated and maintained to continuously provide corrosion protection to the metal components of that portion of the tank and piping that routinely contain regulated substances and are in contact with the ground. Once installed, CP systems shall not be removed, even if the tank has also been internally lined, as long as steel tanks or connected piping exist on that site. This does not preclude replacement of parts of the CP system which have become defective.
- (b) Periodic Inspections. All storage tank systems equipped with CP systems shall be inspected for proper operation by a qualified CP tester in accordance with the following requirements:
- (i) All CP systems shall be tested within six (6) months of installation and at least once every three (3) years thereafter.
- (ii) The criteria that are used to determine that CP is adequate shall be in accordance with the NACE Standard RP0285-2002, "Control of External Corrosion on Metallic Buried, Partially Buried, or Submerged Liquid Storage Systems."
- (iii) All CP systems shall be tested within six months of any repair or substantial modification to the storage tank system, or any other installation on the facility requiring excavation, in accordance with NACE Standard RP0285 2002.
- (c) Impressed Current Systems. Storage tank systems with impressed current CP systems shall also be inspected by the owner and/or operator every sixty (60) days to ensure the equipment is running properly. The owner and/or operator shall make a record of these inspections, including the date of the inspection, the

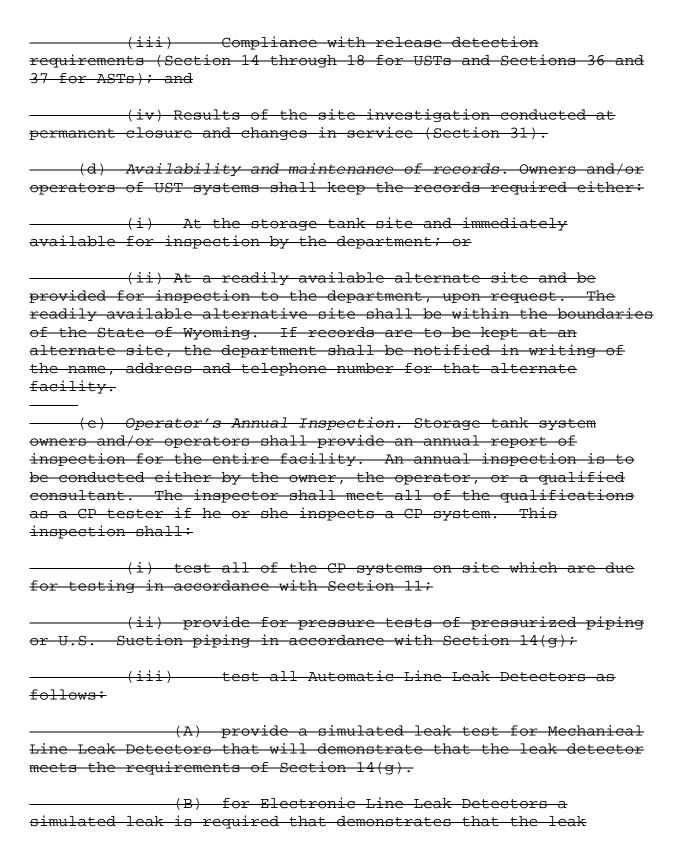

voltage reading on the rectifier, the amperage reading on the rectifier, and the hour reading on a properly connected hour meter showing how long the system has operated since the last inspection. The owner and/or operator shall compare those readings to the readings determined to be correct during the last inspection required under paragraph (b) of this section. Large changes in the voltage or amperage readings, or zero readings, shall be investigated by the owner and/or operator. (d) Records. For storage tank systems using CP, records of the operation of the CP system shall be maintained in accordance with Section 13(c), to demonstrate compliance with the performance standards in this section. These records shall provide the following: (i) The results of testing from the last two (2) CP inspections required in accordance with paragraph (b) of this section; and (ii) The results of the last three (3) CP inspections required in accordance with paragraph (c) of this section. Section 12. Compatibility. (a) Storage tank system(s) shall be made of, or lined with, materials that are compatible with the regulated substance stored. (b) Owners and/or operators storing alcohol blended gasoline shall use the following industry standards or practices to comply with this section: (i) API Publication 1626, "Storing and Handling Ethanol and Gasoline Ethanol Blends at Distribution Terminals and Service Stations"; and (ii) API Publication 1627, "Storage and Handling of Gasoline Methanol Blends at Distribution Terminals and Service

Section 13. Inspection and Right of Entry, Reporting, and

Stations".

Recordkeeping.

(a) Inspection and Right of Entry. Any authorized agent of the State of Wyoming has the right of entry for inspection, assessments and corrective actions in accordance with the provisions of W.S. 35-11-1422. (b) Reporting. Owners and/or operators of storage tank systems shall cooperate fully with inspections, monitoring, and testing conducted by the department, as well as requests by the department for the following document submission(s), testing, and monitoring information: (i) Notification for all storage tank systems (Section 9), which includes certification of installation for new storage tank systems (Section 6(e) for USTs and Part I for ASTs); (ii) Reports of all releases including suspected releases (Section 19), spills and overfills (Section 22), and confirmed releases (Sections 23 through 25); (iii) A notification before permanent closure, change of status, or change-in-service Part G); (iv) Owners and/or operators eligible for the state corrective action program shall comply with the requirements contained in Section 25. (v) Owners and/or operators not eligible for the state corrective action program shall comply with the requirements contained in Section 24. (vi) Owners and/or operators shall cooperate fully with inspections, including providing access to all manholes, dispenser cabinets, CP rectifiers, and tank monitoring equipment. Compliance with this section will require that owners and/or operators open manholes and other access points so that DEQ inspectors may see the condition of all equipment. (c) Recordkeeping. Owners and/or operators shall submit the following information to the department: (i) Documentation of operation of CP Systems (Section $\frac{11}{11}$; (ii) Documentation of storage tank system repairs (Section 8);

electrical test of the system is not sufficient to meet this requirement. (C) When sump sensors are used to meet the requirement for an Automatic Line Leak Detector, they shall be configured to meet the requirements of Section 14(g) and the annual inspection shall include a manual tripping of each sump sensor. The automatic device used to monitor sump sensors shall be triggered by the manual tripping of the sensors, and a record shall be made showing the date when the test was done, the facility number, and recording the fact that the sensor operated as required. (iv) document that all Automatic Tank Gauges (ATG), interstitial monitoring systems, vapor monitoring systems, or other automatic systems are properly calibrated and functioning. This includes a check to determine if probes are clean and are the proper ones for the regulated substance being stored. (v) provide an annual summary for all inventory control calculations, statistical inventory reconciliation reports, or other leak detection methods which shows compliance for each month of the preceding year. Records of the operation of all leak detection systems for the past three (3) years are required to be kept. (vi) include a physical inspection of all sumps, manholes, dispensers, and other openings provided on the storage tank system. Any leaks found shall be immediately eliminated. PART D UST SYSTEMS: RELEASE DETECTION Section 14. Requirements for All UST Systems. (a) Release Detection. Owners and/or operators of UST systems shall provide a method, or combination of methods, of release detection that: (i) Can detect a release from any portion of the tank and the connected piping that routinely contains a regulated substance;

detector meets the requirements of Section 14(q). An internal

(ii) Is installed, calibrated, operated, and maintained in accordance with the manufacturer's instructions, including routine maintenance and service checks showing that the leak detection equipment is fully operational and in proper calibration; and (iii) Meets the performance requirements in Sections 15, 16, or 17, with any performance claims and their manner of determination described in writing by the equipment manufacturer or installer. Methods used shall be capable of detecting the leak rate or quantity specified for that method in Sections 15, 16, or 17 with a probability of detection of 0.95 and a probability of false alarm of 0.05. (b) Release Reporting. When a release detection method operated in accordance with the performance standards in Sections 15, 16, or 17 indicates a release may have occurred, owners and/or operators shall notify the department in accordance with Part F. (c) Timing. Owners and/or operators of new or existing UST systems shall comply with the release detection requirements of this part immediately upon installation. (d) USTs without leak detection. Any owner and/or operator of an UST system that cannot apply a method of release detection that complies with the requirements of this part shall complete the closure procedures in Part G. (e) Petroleum USTs less than 1000 gallons. Owners and/or operators of USTs with a capacity of one thousand (1,000) gallons or less may use manual tank gauging as the sole leak detection method for the tank. Manual tank gauging shall be conducted weekly in accordance with Section 15 (a). (f) Petroleum USTs with a throughput of less than 15,000 gallons per month. Not withstanding any other provision of this chapter, owners and/or operators of USTs with a throughput of less than 15,000 gallons per month may use inventory control as a monthly monitoring technique provided that: (i) the inventory control balances within 150 gallons per month. In the event that a single month fails to balance

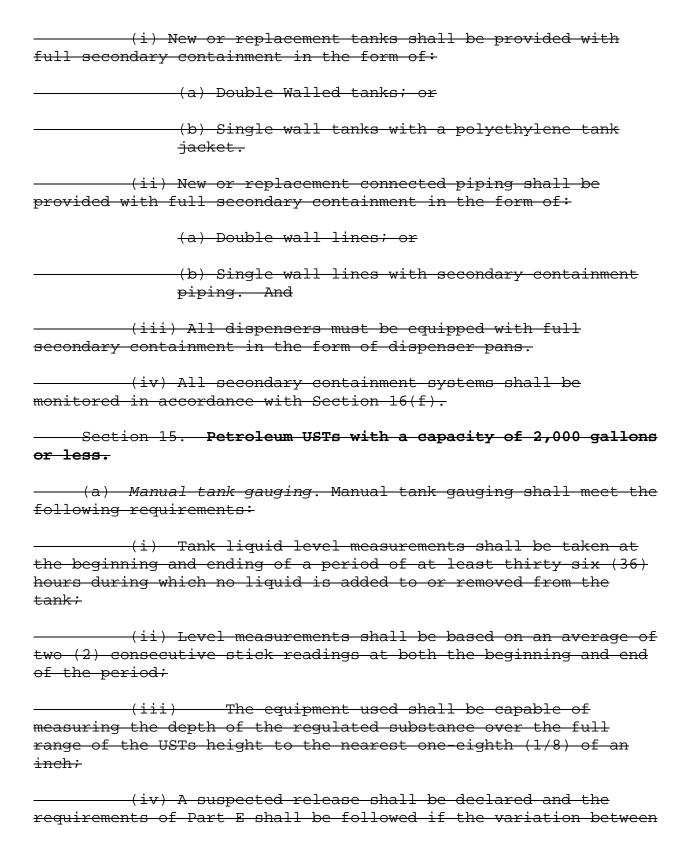

within 150 gallons, the operator shall immediately submit that

month to an outside vendor for Statistical Inventory

Reconciliation;

(ii) the USTs are secured against theft in such a way that any theft is readily obvious; and (iii) all of the requirements listed under Section 16(a) are met. (g) Piping. Connected piping that routinely contains regulated substances shall be monitored for releases in a manner that meets one (1) of the following requirements: (i) Pressurized piping systems shall: (A) Be monitored in accordance with Section 14(g)(i)(B) below. Whenever pressure systems have multiple dispensers hooked up to dispense product through a single meter, the pressurized piping between the first dispenser and the slave dispenser must also be monitored and tested; and (B) Be equipped with an automatic line leak detector in accordance with the following: Methods which alert the owner and/or operator to the presence of a leak by restricting or shutting off the flow of regulated substances through piping or triggering an audible or visual alarm, may be used only if they detect leaks of three (3) gallons per hour at ten (10) pounds per square inch line pressure within one (1) hour. An annual test of the operation of the leak detector shall be conducted. Manufacturers are required to recommend procedures to be used for testing their own equipment, but all automatic line leak detectors shall be tested annually. No manufacturer shall recommend that its equipment not be tested nor interfere with the testing of its equipment in any way. In addition all underground pressurized piping shall: (1) have an annual line tightness test. A periodic test of piping may be conducted only if it can detect a 0.1 gallon per hour leak rate at one and one half (1 1/2) times the operating pressure. Tests performed by automatic systems are specifically allowed in meeting this requirement; or (2) be tested using any of the methods listed in Section 16(d), (e), (f), (g), (h) or (j). Methods not specifically named in these regulations shall be approved prior to use by the department, pursuant to Section 33, and that

approval must state that the method will detect a leak in lines.
(ii) A U.S. Suction system is a system of underground
piping which conveys a regulated substance using suction and
which has more than one check valve in the line. All U.S.
Suction systems shall:
(A) have a line tightness test performed once
every three (3) years. A periodic test of piping may be
conducted only if it can detect a 0.1 gallon per hour leak rate
at one and one half (1 1/2) times the operating pressure; or
(B) be tested using any of the methods listed in
Section 16 (d), (e), (f), (g) or (j). Methods not specifically
named in these regulations may be used if they are approved prior
to use by the department, pursuant to Section 33 and that
approval must state that the method will detect a leak in the
lines.
(iii) IIIndonessand minima that results and the
(iii) Underground piping that conveys regulated
substances using an exempt suction system is not required to have
a release detection system. An exempt suction system is one that
is designed and constructed to meet the following requirements:
(A) The below-grade piping operates at less than
atmospheric pressure;
acmospheric pressurer
(B) The below-grade piping is sloped so that the
contents of the pipe will drain back into the storage tank if the
suction is released;
succion is released?
(C) Only one check valve is included in each
suction line;
buccion file,
(D) The check valve is located directly below and
as close as practical to the suction pump; and
and office one franctions of the franction franctions
(E) A method shall be provided that allows
compliance with this section to be readily determined.
(h) New UST installations and repairs. Regardless of any
other section in this chapter, after the effective date of this
chapter, all new and replacement installations and repairs of
existing piping shall meet the following secondary containment
criteria:

beginning and ending measurements exceeds the weekly or monthly standards in Table 1;

TABLE 1
MANUAL TANK GAUGING VARIATION STANDARDS

Nominal Tank Capacity		Weekly Standard (one test)	Monthly Standard (average of four tests)	Minimum Test Duration Hours*
If Manual Tank Gauging is the ONLY leak detection method used:				
	550 gallons or less	10 gallons	5 gallons	36
	551-1,000 gallons (when the tank is 64" x 73" or less)	9 gallons	4 gallons	44
	1,000 gallons (if tank is 48" x 128")	12 gallons	6 gallons	58
If Manual Tank Gauging is combined with tank tightness testing:				
	1,001 2,000 gallons	26 gallons	13 gallons	36

* Nothing can be added to or removed from the UST for the duration of the test.

(v) Owners and/or operators of USTs of one thousand (1000) gallons or less nominal capacity may use Manual Tank Gauging as the sole method of release detection. Owners and/or operators of USTs of one thousand one (1001) to two thousand (2,000) gallons may use manual tank gauging, combined with tank tightness testing at least every five (5) years until ten (10) years after the UST itself first met the requirements of Section 6(a). After ten (10) years, owners and/or operators of these tanks may not use manual tank gauging. Owners and/or operators of USTs of greater than two thousand (2,000) gallons nominal capacity may not use manual tank gauging.

(b) Other Methods. Owners and/or operators of petroleum
USTs with a capacity of 2,000 gallons or less may also use any of

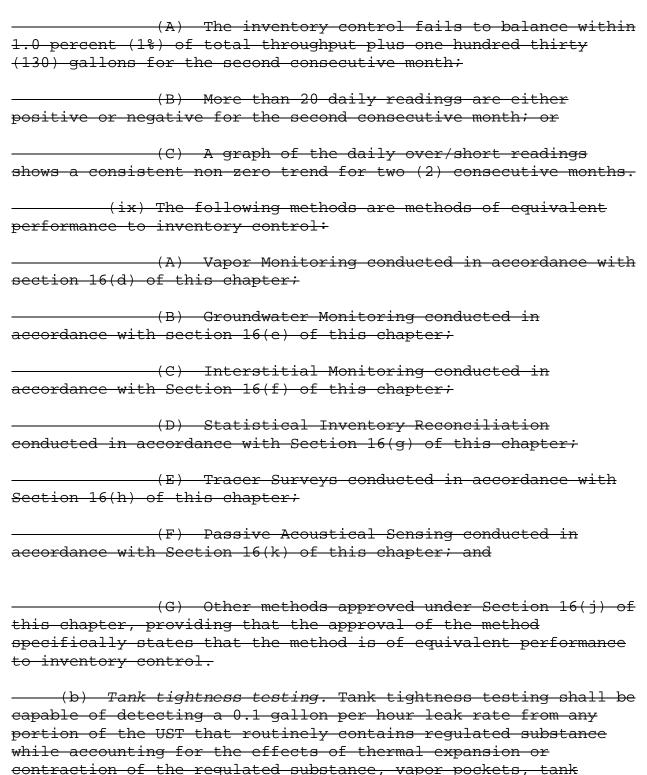

the methods listed in Section 16(a) through (k). Section 16. Petroleum UST Systems with a capacity of more than 2,000 gallons. Petroleum USTs with a capacity of more than 2,000 gallons shall be monitored at least every thirty (30) days for releases using one or more of the following methods: (a) Inventory control. Inventory control is never acceptable as a leak detection method except when it is combined with another method. Product inventory control (or another test of equivalent performance) shall be conducted monthly to detect a release of at least 1.0 percent (1%) of throughput plus one hundred thirty (130) gallons in the following manner: (i) Inventory volume measurements for regulated substance inputs, withdrawals, and the amount still remaining in the UST shall be recorded each operating day; (ii) The equipment used shall be capable of measuring the depth of regulated substance over the full range of the USTs height to the nearest one-eighth (1/8) of an inch; (iii) The regulated substance inputs shall be reconciled with delivery receipts by measurement of the UST inventory volume before and after delivery; (iv) Deliveries shall be made through a drop tube that extends to within six (6) inches of the Storage Tank bottom; (v) Dispensing of regulated substances shall be metered and recorded within the local standards for meter calibration or an accuracy of six (6) cubic inches for every five (5) gallons of regulated substance withdrawn; and (vi) Water in the bottom of the UST shall be measured to the nearest one-eighth (1/8) of an inch at least once a month. (vii) Owners and/or operators using inventory control may combine this method with tank tightness testing at least

(viii) Owners and/or operators using inventory control shall report a suspected release under Section 19(c) of this

every five (5) years until December 22, 2008, or until ten (10) years after the UST itself first met the requirements of Section

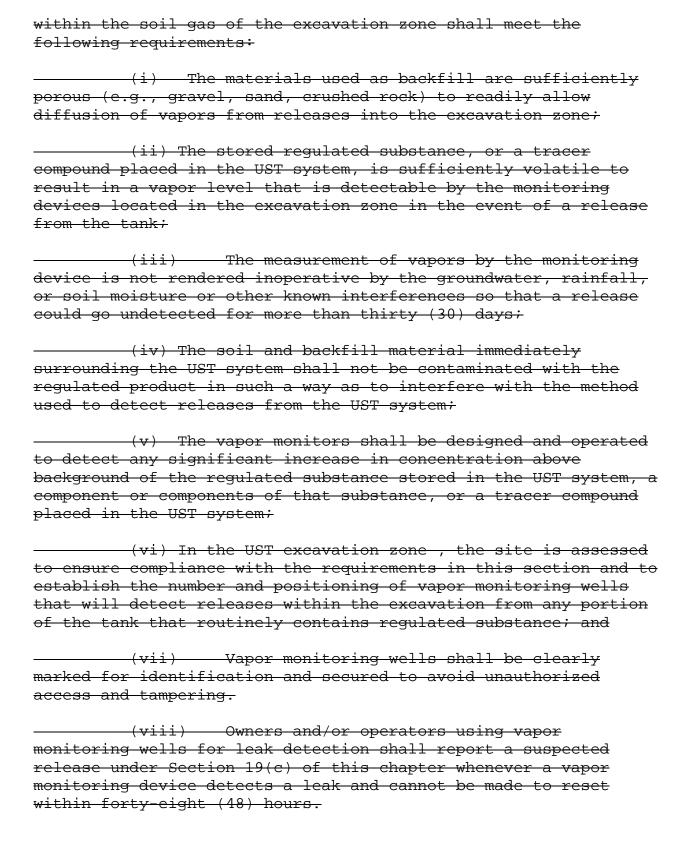

6(a), whichever is sooner;

chapter whenever:

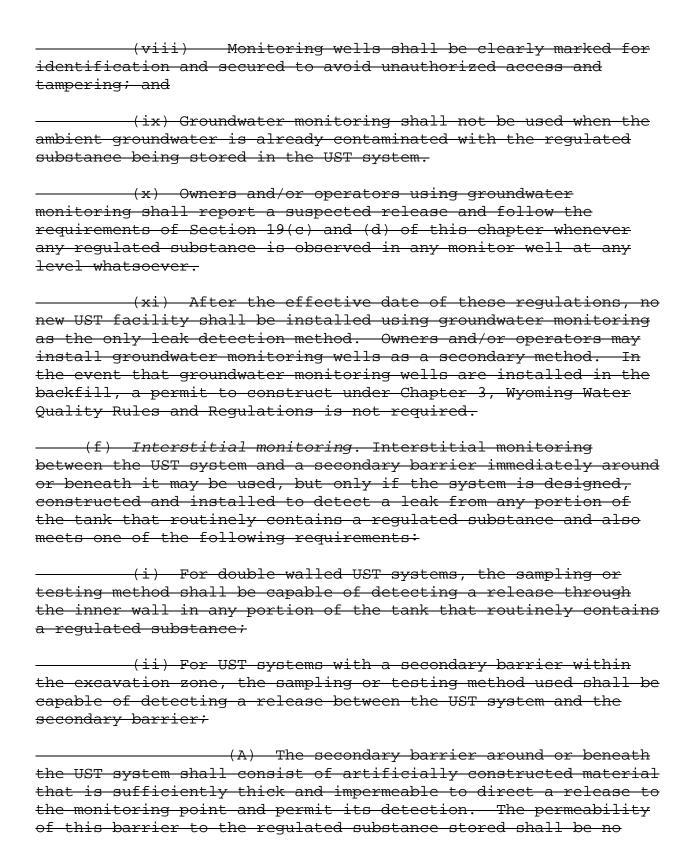

deformation, evaporation or condensation, and the facility of the

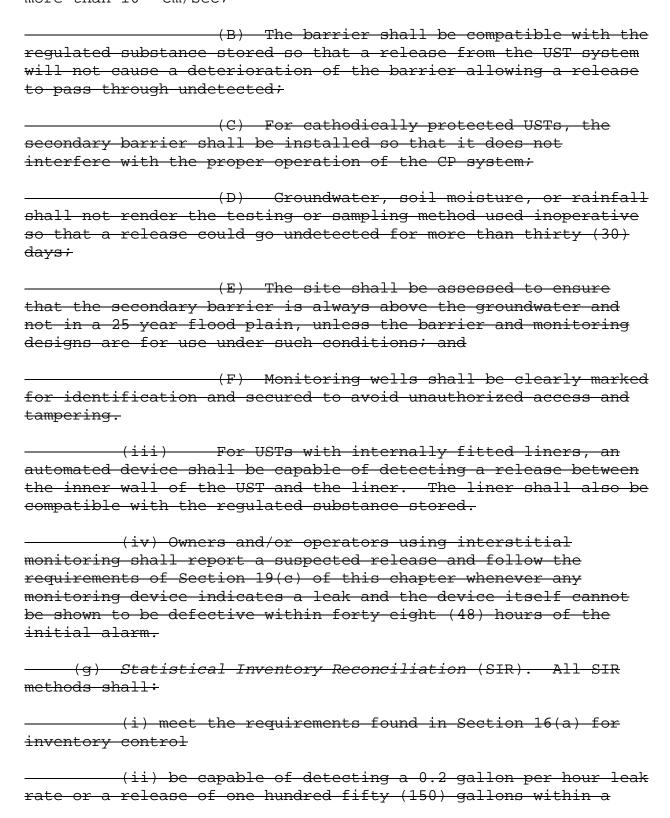

(ix) After the effective date of these regulations, no
new UST facility shall be installed using vapor monitoring as the
only leak detection method. Owners and/or operators may install
vapor monitoring wells as a secondary method. In the event that
vapor monitoring wells are installed in the backfill, a permit to
-
construct under Chapter 3, Wyoming Water Quality Rules and
Regulations is not required.
- (e) Groundwater monitoring. Testing or monitoring for
liquids on the groundwater shall meet the following requirements:
riquids on the groundwater sharr meet the rorrowing requirements.
(i) The regulated substance stored is immiscible in
water and has a specific gravity of less than one (1);
(ii) Groundwater is never more than twenty (20) feet
-
from the ground surface, and the hydraulic conductivity of the
soil(s) between the UST system and the monitoring wells or
devices is not less than 0.01 cm/sec (e.g., the soil should
consist of gravels, coarse to medium sands, coarse silts or other
<pre>permeable materials);</pre>
(iii) The slotted portion of the monitoring well
casing or well screen shall be designed to prevent migration of
natural soils or filter pack into the well and to allow entry of
regulated substance on the water table into the well under both
high and low groundwater conditions;
(iv) Monitoring wells shall be sealed from the ground
surface to the top of the filter pack with hydrated bentonite and
concrete;
() Manitarina valla on davida aball intercept the
(v) Monitoring wells or devices shall intercept the
excavation zone or are as close to it as is technically feasible;
(vi) The continuous monitoring devices or manual
methods used shall be capable of detecting the presence of at
least one-eighth (1/8) of an inch of free product on top of the
groundwater in the monitoring wells;
(vii) Within and immediately below the UST
excavation zone, the site shall be assessed to ensure compliance
with the requirements in Section 16(e)(i) through (v) and to
establish the number and positioning of monitoring wells or
devices that will detect releases from any portion of the UST
gratem that wentinely contains a wegulated substance:

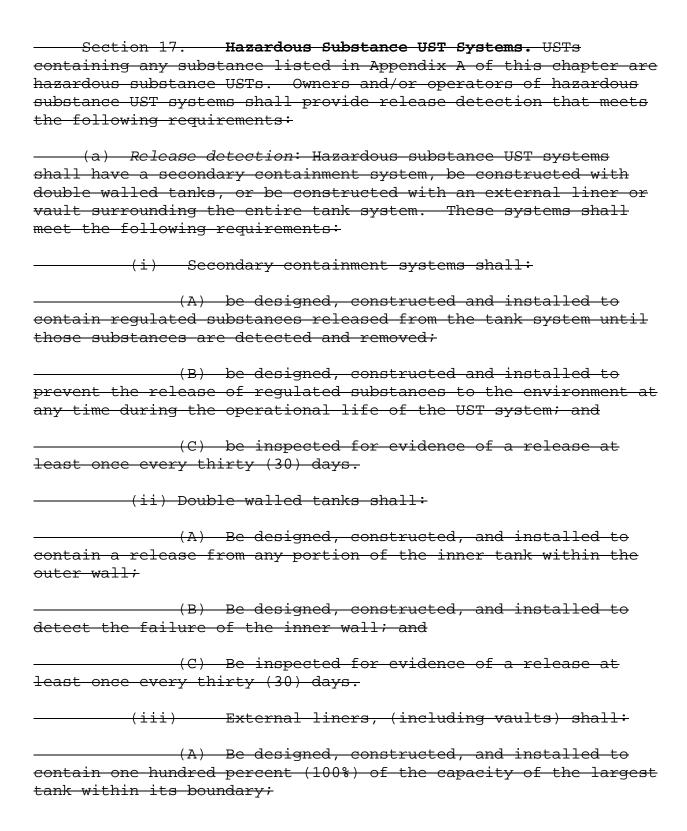

more than 10-6 cm/sec;

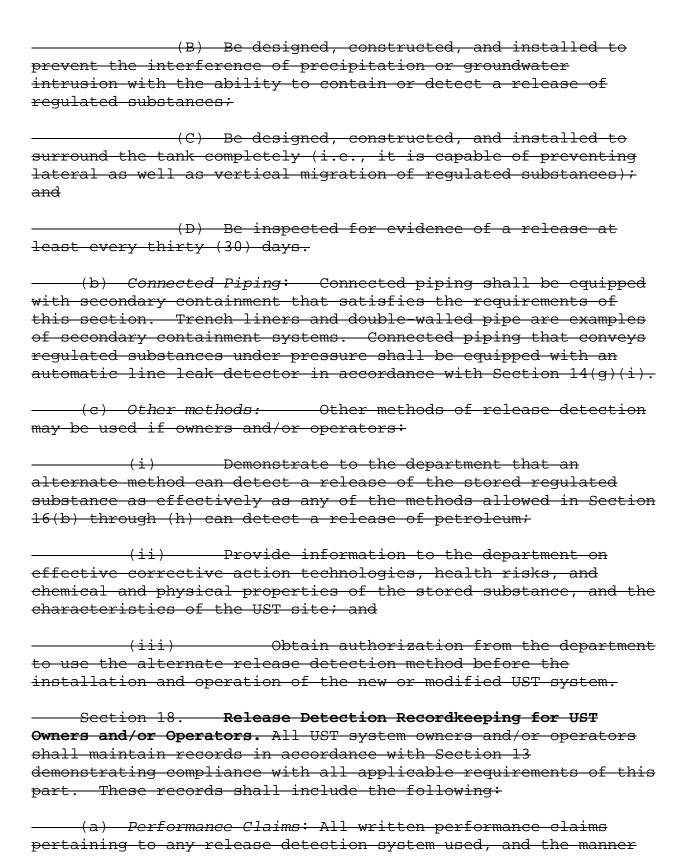

month with a probability of detection of at least 0.95 and a
probability of false alarm of no more than 0.05; and
•
(iii) be approved, in writing, by the department
prior to use.
(iv) All "inconclusive" results shall be investigated
by the owner and/or operator as soon as they are reported by the
SIR company, including a complete audit of all input data. The
owner and/or operator shall make every effort to resolve all
"inconclusive" results as soon as they are reported. If the
inventory for an entire month fails to balance within two
thousand (2,000) gallons, that month shall be treated as
inconclusive. A month with an un resolved inconclusive result is
a month when no valid leak detection was provided.

(v) Owners and/or operators using SIR shall report a
suspected release and follow the requirements of Section 19(c) of
this chapter whenever:
(A) Any single month is reported as a failure for
the UST system by the SIR company;
(B) Any month is reported by the SIR company as
"inconclusive" unless that inconclusive result has been resolved
by re submission of audited inventory numbers to the SIR company.
To a manufacture of the manufacture of the second of the s
(vi) UST Systems with a throughput of more than 500,000
gallons per month in any single system shall not be monitored
using SIR as the only release detection method.
abing bit ab the only release acception method.
(h) Tracer Surveys. Owners and/or operators may use tracer
surveys as an approved monthly monitoring technique if:
burveyb ab an approved monenty monreoring econnique ir
(i) The tracer method can detect a 0.2 gallon per hour
leak rate or a release of one hundred fifty (150) gallons within
a month with a probability of detection of 0.95 and a probability
of false alarm of 0.05; and
or raise araim or 0.037 and
(ii) The tanks are inoculated with the same tracer each
month;
(iii) The tanks are inoculated each month before
the 10th day of the month;
CIIC IOCII MAY OI CIIC IIICIICII

(iv) The Tracer Survey is completed before the 25th day
of each month;
(v) The report for each month includes the calculations of the amount of tracer needed, the amount actually added to each tank, and the calculated leak detection limit in
gallons per day; and
(vi) The report for each test clearly states that the tank(s) either passed or failed the test.
(vii) Any failing test using tracer surveys shall be treated as a suspected release under Section 24 or 25.
(i) Passive Acoustic Sensing. Owners and/or operators of Storage Tanks using this method shall be equipped with a continuous sensing system capable of detecting a release of 0.2 gallons per hour or a release of 150 gallons per month with a probability of detection of 0.95 and a probability of false alarm of 0.05. All passive acoustic sensing systems shall produce a written record showing that the system is on and operable. All passive acoustic sensing systems shall be calibrated annually;
(j) Other technology. With prior department authorization, pursuant to Section 33, other types of release detection methods or combination of methods, may be used if:
(i) The method can detect a 0.2 gallon per hour leak rate or a release of one hundred fifty (150) gallons within a month with a probability of detection of 0.95 and a probability of false alarm of 0.05; or
(ii) The owner and/or operator can demonstrate that the method can detect a release as effectively as any of the methods allowed in Section 16 (b) through (h). In comparing methods, the department shall consider the size of release that the method can detect and the frequency and reliability with which it can be detected. If the method is approved, the owner and/or operator shall comply with any conditions imposed by the department to ensure the protection of human health and the environment.
(k) Multiple Methods. Whenever these regulations require the use of more than one leak detection method, the owners and/or operators shall meet all of the requirements for all of the leak detection methods required

in which these claims have been justified or tested by the equipment manufacturer or installer, shall be maintained for three (3) years, from the date of installation;

- (b) Test Results: The results of any sampling, testing, or monitoring shall be maintained for at least three (3) years; and
- (c) Calibration, Maintenance and Repair: Written documentation of all calibration, maintenance, and repair of release detection equipment permanently located on site shall be maintained for the operational life of the tank in accordance with W.S. 35-11-1416(a)(vi). Any schedules of required calibration and maintenance provided by the release detection equipment manufacturer shall be retained for the operational life of the tank.

STORAGE TANK SYSTEMS:

RELEASE REPORTING, INVESTIGATION, CONFIRMATION
- AND RESPONSE

- Section 19. Reporting of Suspected Releases. Owners and/or operators of storage tank systems shall orally report to the department within twenty-four (24) hours all releases or suspected releases in accordance with Section 22 and follow the procedures of Section 22. Owners of sites where storage tanks were formerly located shall also report within seven (7) days after discovering any new evidence of a release. These reports shall be made for any of the following conditions:
- (a) Released Regulated Substances: The discovery by owners and/or operators or others of released regulated substances at the storage tank site or in the surrounding area (such as the presence of free product or vapors in soils, basements, utility lines, nearby surface water and/or groundwater);
- (b) Unusual operating conditions: Unusual operating conditions observed by owners and/or operators (such as the erratic behavior of product dispensing equipment, the sudden loss of a regulated substance from the storage tank system, or an unexplained presence of water in the storage tank), unless system equipment is found to be defective but not leaking, and is immediately repaired or replaced; and
- (c) Monitoring results: Monitoring results from a release detection method required under Section 14 through 17 that indicate a release may have occurred unless the monitoring device is found to be defective, and is immediately repaired, recalibrated or replaced, and additional monitoring does not confirm the initial result.
- (d) Off-site Impacts. Owners and/or operators of storage tank systems, and owners of former storage tank sites, shall follow the applicable procedures in Section 20 or 21 to determine if the storage tank system is the source of off-site impacts. These impacts include the discovery of regulated substances (such as the presence of free product or vapors in soils, basements, utility lines, nearby surface water and groundwater) that have been observed by the department or brought to its attention by another party.

- Section 20. Release Investigation and Confirmation for Eligible Owners and/or Operators. Owners and/or operators of storage tanks who are eligible for cleanup under the Corrective Action Account shall immediately investigate and confirm all suspected releases of regulated substances requiring reporting under Section 19 within seven (7) days of detection as follows:
- (a) System test. Owners and/or operators shall conduct tests, according to the requirements for tightness testing in Section 14 (g) and Section 16 (b), that determine whether a leak exists in that portion of the storage tank system that routinely contains a regulated substance. Owners and/or operators of all storage tanks shall also audit one year's inventory control required by Section 16(a) or 36(e).
- (i) Owners and/or operators shall repair, replace, or permanently close the storage tank system if the test results for the system, tank, or delivery piping indicate that a leak exists.
- (ii) Owners and/or operators shall also conduct a thorough audit of all of their leak detection methods for the preceding year. This audit shall be performed by a qualified third party, employed for this purpose by the owner and/or operator. In the event that the audit indicates a pattern of releases over several months, then the department will accomplish the site check as described in Section 20 (c).
- (iii) Further investigation is not required if the test results for the system, tank, delivery piping and the audit do not indicate that a leak exists and if environmental contamination is not the basis for suspecting a release.
- (b) Further Action. If the test results required under Section 20 (a) do not indicate a release, but environmental contamination is the basis for suspecting a release, the department will accomplish the site check as required under Section 20 (c) and all other required Part E activities, as determined by the administrator.
- (c) Site check. The department shall test for the presence of a release where contamination is most likely to be present at the storage tank site. In selecting sample types, sample locations, and measurement methods, the department shall consider the nature of the stored regulated substance, the type of initial

alarm or cause for suspicion, the type of backfill, the depth of groundwater, and other factors appropriate for identifying the presence and source of the release. If the test results for the site check do not indicate that a release has occurred, further investigation is not required.

(d) Plans and Specifications, All plans, specifications and reports filed under this section with the department shall also be signed and sealed by a Registered Professional Engineer under W.S. 33 29 114 through 33 29 149 and/or a Registered Professional Geologist under W.S. 33 41 101 through 33 41 121, as applicable.

Section 21. Release Investigation and Confirmation for Owners and/or Operators Not Eligible for the Corrective Action Account. Owners of contaminated sites and Owners and/or Operators of storage tanks may become ineligible for cleanup under the Corrective Action Account for any of the reasons listed in W.S. 35 11 1424. Owners and/or Operators who are not eligible for cleanup under the Corrective Action Account shall immediately investigate and confirm all suspected releases of regulated substances requiring reporting under Section 19 within seven (7) days of detection as follows:

(a) System test. Owners and/or operators shall conduct tests, according to the requirements for tightness testing in Section 14(g) and Section 16(b), that determine whether a leak exists in that portion of the tank that routinely contains regulated substance, or the connected piping, or both. Storage tank Owners and/or operators shall also audit all inventory control required under Sections 16(a) or 36(e) for the year prior to the suspected release.

(i) Owners and/or operators shall repair, replace, or permanently close the storage tank system if the test results for the system indicate that a leak exists.

(ii) When environmental contamination is the basis for suspecting a release, owners and/or operators shall also conduct a thorough audit of all of their leak detection methods for the preceding year. This audit shall be performed by a qualified third party, employed for this purpose by the owner and/or operator. In the event that the audit indicates a pattern of releases over several months, owners and/or operators shall conduct a site check as described in Section 20(c).

(iii) Owners and/or operators shall conduct a minimum site assessment as described in Section 29 any time that the results of the system test described in Section 21(a) indicate that a leak exists, or if environmental contamination is the basis for suspecting a release.

(b) Further Action. Further investigation is not required if the system test results required under Section 21(a) do not indicate that a leak exists and if environmental contamination is not the basis for suspecting a release. If the test results for the excavation zone at an UST site or the results for the area immediately adjacent to the storage tank system at an above ground storage tank site indicate that a release has occurred, owners and/or operators shall begin corrective action in accordance with Part E;

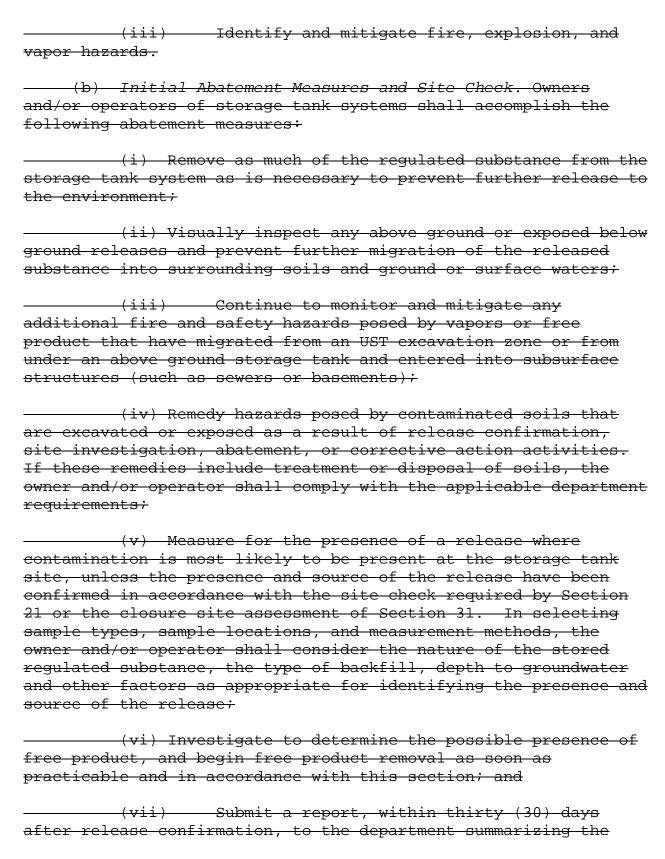

- (c) Permits Required. Owners of contaminated sites and/or owners and/or operators of storage tank systems shall also ensure that all necessary department permits for groundwater monitoring or product recovery wells have been issued prior to initiating site check activities.
- (d) Plans and Specifications. All plans, specifications and reports filed this section with the department shall also be signed and sealed by a Registered Professional Engineer under W.S. 33 29 114 through 33 29 149 and/or a Registered Professional Geologist under W.S. 33-41-101 through 33-41-121, as applicable.

Section 22. Reporting and Cleanup of Spills and Overfills.

(a) Cleanup and 24 hour reporting: Owners and/or Operators of storage tank systems shall contain and immediately clean up a spill or overfill and orally report to the department within twenty-four (24) hours all spills or overfills by telephone to (307) 777 7781, by FAX transmission to (307) 777 5973, or by electronic mail to http://deq.state.wy.us/ and begin corrective action in accordance with Sections 23 through 25 in the following cases:

(i) Spill or overfill of petroleum that results in a release to the environment that exceeds 25 gallons or that causes a sheen on nearby surface water; and/or

- (ii) Spill or overfill of a regulated hazardous substance that results in a release to the environment that equals or exceeds its reportable quantity under CERCLA (40 CFR Part 302).
- (b) Owners and/or operators Costs: Costs incurred by owners and/or operators to contain and/or cleanup surface spills and/or overfills are not eligible for the state correction action program funds. Leaks that occur within a dispenser cabinet at or above the fire valve are considered surface spills and are not eligible for cleanup under the Corrective Action Account. Leaks that occur below the fire valve are leaks from piping and are eligible for cleanup under the Corrective Action Account.
- (c) Small Spills: Owners and/or operators of storage tank systems shall contain and immediately cleanup a spill or overfill of petroleum that is less than 25 gallons and a spill or overfill of a hazardous substance that is less than the reportable quantity. If cleanup cannot be accomplished within twenty-four (24) hours, owners and/or operators shall immediately notify the department.
- Section 23. General. Owners and/or operators of storage tank systems, and owners of former storage tank sites, shall, in response to a confirmed release from the storage tank system, comply with the requirements of this part except for USTs excluded under Section 4(b) of this chapter.
- Section 24. Owners and/or Operators Not Eligible for the State Corrective Action Program.
- (a) Initial Response. Upon confirmation of a release in accordance with Section 21 or after a release from the storage tank system is confirmed in any other manner, owners and/or operators shall perform the following initial response actions within twenty four (24) hours of a release:
- (i) Orally report the release to the department by telephone, (307)777-7781, by electronic mail to http://deq.state.wy.us/, or by FAX to (307)777-5973;
- (ii) Take immediate action to prevent any further release of the regulated substance into the environment; and

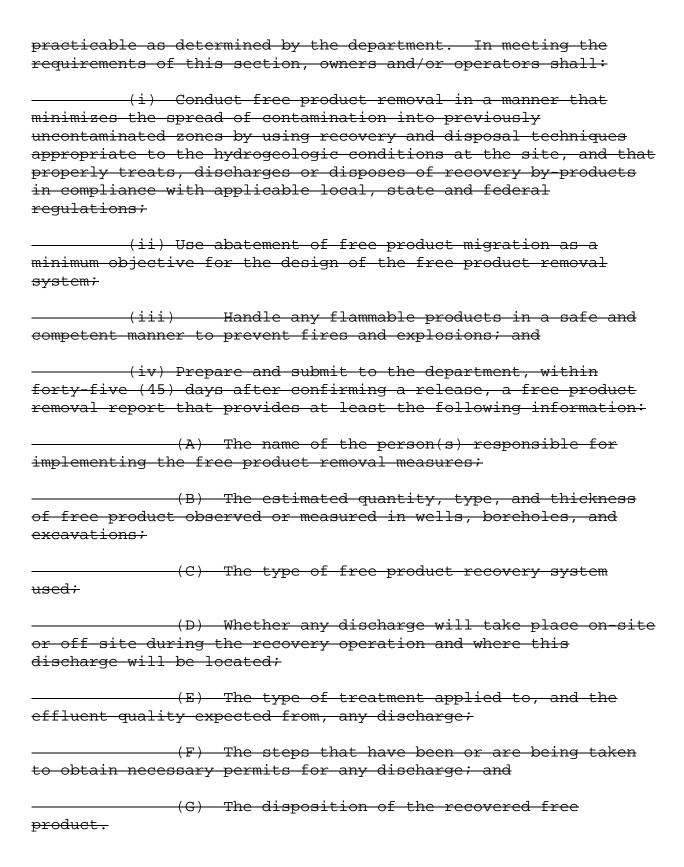

data required by this section. (c) Initial Site Characterization. Owners and/or operators shall assemble information about the site and the nature of the release, including information gained while confirming the release or completing the initial abatement measures of this section. This information shall include, but is not limited to, the following: (i) Data on the nature and estimated quantity of release; (ii) Data from available sources and/or site investigations concerning the following factors: surrounding populations, water quality, use and approximate locations of wells potentially affected by the release, subsurface soil conditions, locations of subsurface sewers, climatological conditions, and land use; (iii) Results of the site check required under Section 24(b); (iv) The results of the free product investigations required under Section 24 (b), shall be used by owners and/or operators to determine whether free product shall be recovered under Section 24 (d); (v) Within sixty (60) days of release confirmation, owners and/or operators shall submit the information collected in compliance with this section to the department in a manner that demonstrates its applicability and technical adequacy; and (vi) Information necessary to classify the affected groundwater under Chapter 8, Wyoming Water Quality Rules and Regulations. (d) Free Product Removal. When free product is discovered,

initial abatement steps taken and any resulting information or

owners and/or operators shall contact the department within

(b) indicate the presence of free product. Owners and/or operators shall remove free product to the maximum extent

twenty-four (24) hours of the discovery by telephone, (307) 777-7781, by electronic mail to http://deq.state.wy.us/, or by FAX to (307) 777-5973. Owners and/or operators shall present a CAP for product removal at sites where investigations under Section 24

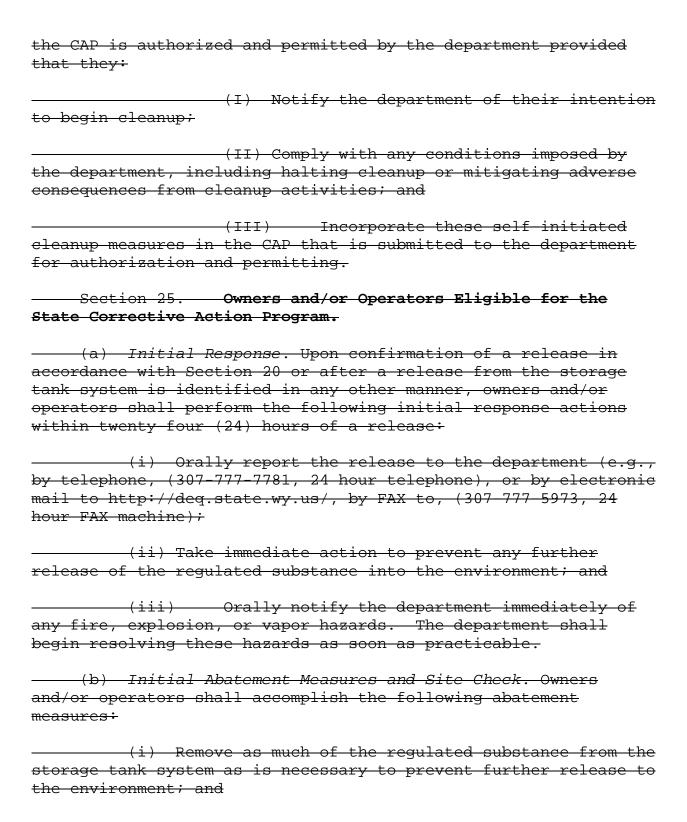

(e) Investigation for Soil and Groundwater Cleanup. In order to determine the full extent and location of soils contaminated by the release and the presence and concentrations of dissolved product contamination in the groundwater, owners and/or operators shall conduct a subsurface investigation of the release, the release site, and the surrounding area possibly affected by the release to determine if any of the following conditions exist: (i) There is evidence that groundwater wells have been affected by the release (e.g., as found during release confirmation or previous corrective action measures); (ii) Free product is discovered on the groundwater table in compliance with this section; (iii) There is evidence that contaminated soils may be in contact with groundwater (e.g., as found during the initial response measures or investigations required under this section); (iv) The department requests an investigation based on the potential threats of contaminated soil or groundwater on nearby surface water and groundwater resources; (v) Owners and/or operators shall submit the information collected under this section in accordance with a schedule established by the administrator. (f) Corrective Action Plan (CAP). (i) Any owner and/or operator, the department, or other person, taking a corrective action required by this regulation, shall restore the environment to a condition and quality consistent with the standards established in Sections 38 and 39. (ii) At any point after reviewing the information submitted in compliance with Sections 24 through 26, the department may require owners and/or operators to submit additional information, or to develop and submit a CAP for responding to contaminated soils and groundwater. If a plan is required, owners and/or operators shall submit the plan according to a schedule and format established by the department. Alternatively, owners and/or operators may, after fulfilling the

requirements of Sections 24 through 26, choose to submit a CAP

case, owners and/or operators are responsible for submitting a plan that provides for adequate protection of human health and/or restoration of the environment, as determined by the department, and shall modify their plan as necessary to meet the requirements of this regulation. (A) The department will authorize and issue applicable department permits for the CAP only after ensuring that implementation of the plan will adequately protect human health, safety, and the environment, and the plan is in compliance with other applicable department rules and regulations. In making this determination, the department will consider the following factors: (I) The physical and chemical characteristics of the regulated substance, including its toxicity, persistence, and potential for migration; (II) The hydrogeologic characteristics of the facility and the surrounding area; (III) The proximity, quality, and current and future uses of nearby surface water and groundwater; (IV) The potential effects of residual contamination on nearby surface water and groundwater; (V) An exposure assessment; and (VI) Any information assembled in compliance with this section. (B) Upon authorization and issuance of applicable department permits for the CAP, owners and/or operators shall implement the plan, including modifications to the plan made by the department. They shall monitor, evaluate, and report the results of implementing the plan in accordance with the schedule and a format established by the department. (C) Owners and/or operators may, in the interest of minimizing environmental contamination, remediating an imminent health and/or safety hazard, and promoting more effective cleanup, begin cleanup of soil and groundwater before

for responding to contaminated soil and groundwater. In either

(ii) Visually inspect any above ground or exposed below
ground releases and prevent further migration of the released
substance into surrounding soils and ground or surface waters;
(c) Site Characterization and Corrective Action. The
department will prioritize the site pursuant to Section 28 after
completion of initial abatement measures. The department will
also collect data on affected groundwater sufficient to classify
the affected groundwater under Chapter 8, Wyoming Water Quality
Rules and Regulations.
Section 26. Public Participation.
(a) Notice Provided: Whenever a confirmed release from an
storage tank system occurs that requires a CAP for soil or
groundwater remediation, the department shall provide notice to
the public by means designed to reach those members of the public
directly affected by the release and the planned corrective
action. This notice may include, but is not limited to, public
notice in local newspapers, block advertisements, public service
announcements, or personal contacts by field staff.
(b) Content of Notices: All public notices issued under
this chapter shall contain the following minimum information:
(') 1 11
(i) Name and address of facility where release
occurred;
(ii) Name and address of armor and/ar anamatar:
(ii) Name and address of owner and/or operator;
(iii) Name and address of the department;
(111) Name and address of the department?
(iv) Name and phone number of department representative
where additional information can be obtained;
where addresonal informacion can be obtained?
(v) Type and estimated volume of the release, if
known; and
(vi) The Class of Use of all affected groundwater as
determined under Chapter 8, Wyoming Water Quality Rules and
Regulations.
J •
(c) Information Requests. Upon request, the department
shall provide or make available information concerning the nature
of the release and corrective actions planned or taken.
of the refease and corrective actions prainted of taken.

Section 27. Corrective Action Prioritization Ranking System.

- (a) Criteria. This ranking system establishes criteria for use by the department in determining priorities for conducting state corrective actions at leaking storage tank sites. The ranking is based upon the following primary factors:
- (i) Degree of immediate adverse health exposure and/or safety hazards to people in nearby occupied buildings or to public utilities.
- (ii) Water quality protection.
- (iii) Potential for contaminant(s) migration.
- (iv) Ecological protection.
- (b) Scoring. The scoring system provides that the sites with the highest scores shall be of the highest priority in conducting department corrective actions. The following listing and point values compose the department's corrective action prioritization ranking system. Points will be applied to each site, as appropriate, depending upon local circumstances. The total score for each leaking storage tank site is the sum of all applicable categories as follows:

TABLE 3
Corrective Action Scoring

Free product on the surface of either surface or groundwater	Point Value
Presence of free product unknown, but possible	100
Presence of free product unknown, but probable	225
Free product in any amount, on groundwater	350

TABLE 3
Corrective Action Scoring

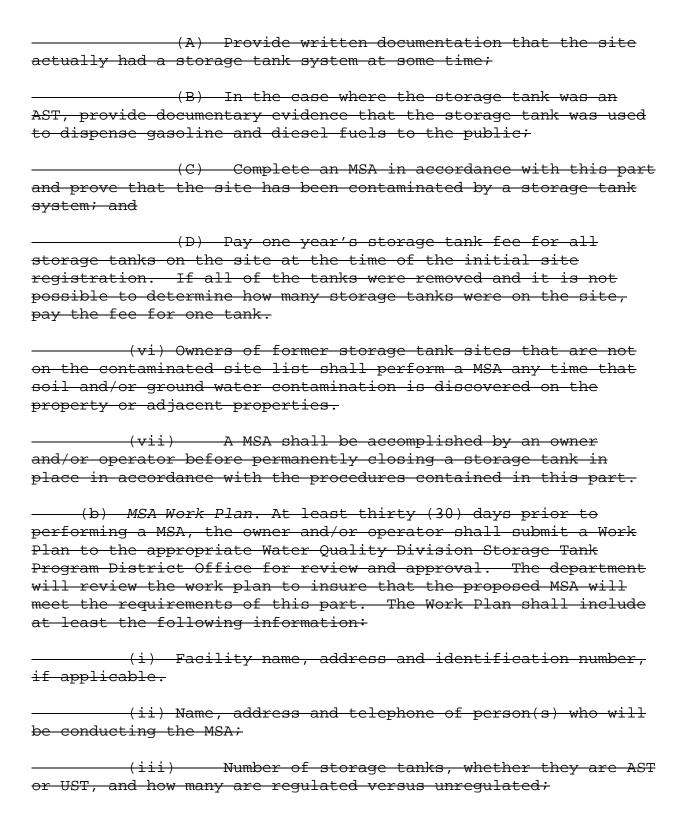

Water contaminated by dissolved chemical substances	Point Value
Greater than ten (10) times the MCL for drinking water or the Wyoming DWEL	300
Less than ten (10) times or equal to the MCL for drinking water or the Wyoming DWEL	100
The above two (2) values shall be doubled if measurements were made in wells used for drinking water.	
Potential to contaminate groundwater	Point Value
Unknown, but probable	175
Unknown, but possible	75
Soil Type	Point Value
High permeability (coarse gravel, silty sands, etc.)	150
Moderate permeability (loamy sands, silty clays, etc.)	75
Low permeability (clays)	25
Soil Contamination	Point Value
Heavily contaminated soils. Fails paint filter test or produces a free product layer when mixed with water and allowed to settle for ten (10) minutes	150
Moderately contaminated soils. Observed greasy feel, strong petroleum odor, black discoloration	80
Slightly contaminated soils. Any visible contamination or weak petroleum odor	40

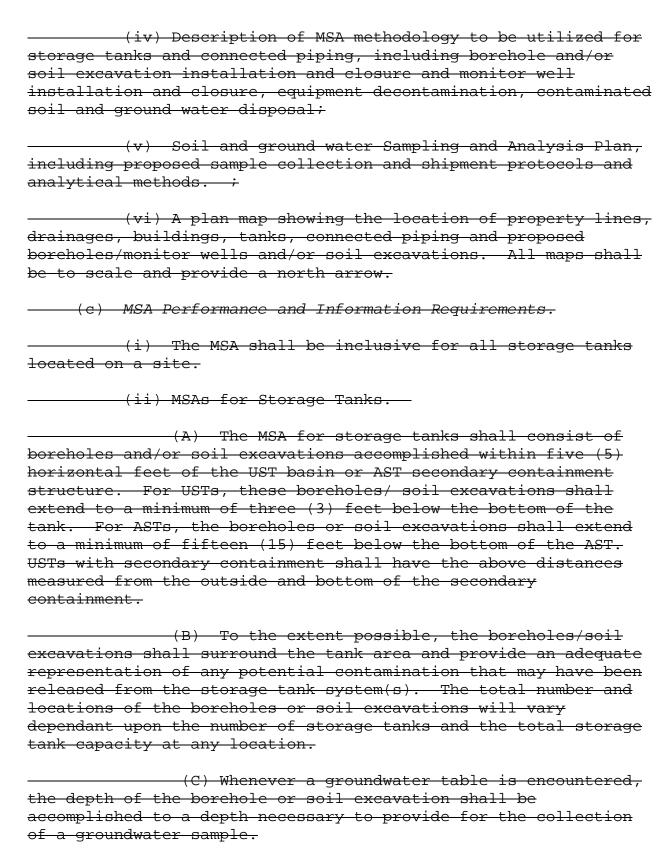

Section 28. Termination of Corrective Actions. Corrective actions that have not met the applicable standard(s) in Sections 39 and 40 may be stopped if the administrator determines that continued operation of those systems is not technically and economically feasible.

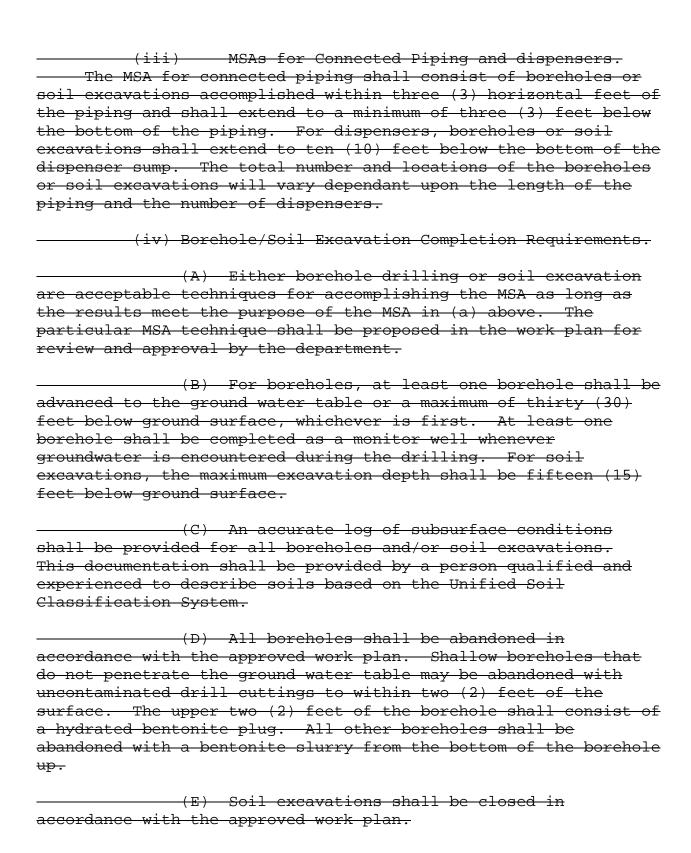

MINIMUM SITE ASSESSMENTS

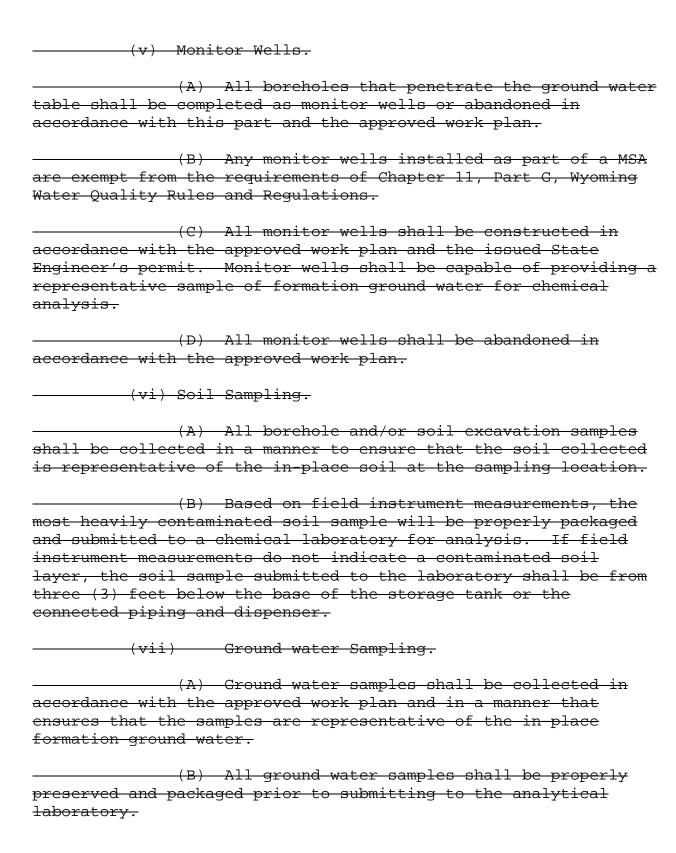

Section 29. MSA Requirements

- (a) When a MSA is Required. MSAs are utilized to determine whether a regulated substance has been released from a storage tank system and, if so, to determine if soil and/or ground water contamination is present in exceedance of applicable standards. The MSA results will determine the site's eligibility for the corrective action fund. MSAs are required when any of the following conditions are met:
- (i) Unless the site is already listed as a contaminated site, all owners and/or operators of regulated ASTs shall, by October 1, 2007, provide a MSA to the department. This MSA shall be done at the owners and/or operators expense and shall meet all of the requirements of this part.
- (ii) Unless the site is already listed as a contaminated site, all UST owners and/or operators which have not previously performed a MSA shall perform a MSA. This MSA shall be performed no sooner than eighteen (18) years, and no later than twenty (20) years, after the tanks were installed, at the owners and/or operators expense. This requirement applies to all USTs installed after September 22, 1988.
- (iii) After the effective date of this chapter, owners and/or operators who remove storage tanks without obtaining the required department inspection shall complete a MSA at their own expense and within forty-five (45) days of the tank removal.
- (iv) After the effective date of this chapter, owners and/or operators who change the use of a regulated tank to a non-regulated use in accordance with Section 31 of this chapter, or change the use of a non-regulated tank to a regulated use shall complete a MSA at their own expense and within forty five (45) days of the change of use.
- (v) Any owner and/or operator of a storage tank system
 which was abandoned prior to the program and who now elects to
 participate in the state program, shall:

(d) Documented contamination. Any contamination documented during this MSA process requires the owner of the contaminated site and/or the owner and/or operator of the storage tanks to implement Part E of this chapter, if the storage tank system is currently in use. (e) MSA Report. Within forty five (45) days after the completion of the MSA, the owner and/or operator shall submit two (2) copies of a summary report of the MSA to the department on a form provided by the department or a consultant's report which at a minimum includes the following information: (i) Facility name, address and ID number, owners name and address and name of person(s) performing the MSA; (ii) Date assessment was accomplished; (iii) Storage tank(s) information, including tank number, capacity, regulated substance stored and depth to top and bottom of tank(s); (iv) Borehole and/or soil excavation information, including borehole/soil excavation identification, total depth, depth to ground water and description of soils and/or ground water; (v) Discussion of any contamination noting depths encountered or lack of contamination discovered; (vi) All analytical results. (vii) Plan map of the location indicating structures, drainages, property lines, location of boreholes or soil excavations, monitor wells tank(s), piping and dispensing pumps. Drawings shall include title, north arrow and scale; The summary report shall be submitted to the appropriate Water Quality Division Storage Tank Program District Office for review and approval.

PART G

STORAGE TANK SYSTEMS: OUT OF SERVICE SYSTEMS AND CLOSURES

Section 30. Temporary Closure.

- (a) General Requirements. When an storage tank system is temporarily closed, owners and/or operators shall continue operation and maintenance of CP systems in accordance with Section 11. Owners and/or operators shall continue release detection in accordance with Part D as long as the tank contains more than one inch of regulated substance at the measuring point directly under the fill tube. Parts E and F shall be complied with if a release is suspected or confirmed.
- (b) Six (6) months or more. When a storage tank system is temporarily closed for six (6) months or more, owners and/or operators shall also comply with the following requirements:
- (i) Leave vent piping open and functioning; and
- (ii) Drain, cap and secure all other connected piping, pumps, manways, and ancillary equipment; and
- (iii) Continue to pay the annual tank fee and maintain financial responsibility pursuant to Chapter 19, Wyoming Water Quality Rules and Regulations, Financial Responsibility for USTs.
- (c) Three (3) years or more. When a storage tank system is temporarily closed for more than three (3) years, the owner and/or operator shall complete a minimum site assessment in accordance with Section 29.

Section 31. Permanent Closure and Changes In Service.

(a) Notification. At least thirty (30) days before beginning either permanent closure or changing a storage tank system to a non-regulated use under Section 31(b) or (c), owners and/or operators shall notify the department of their intent, unless such action is in response to corrective action. The required permanent site closure or Minimum Site Assessment of the excavation zone under Section 29 shall be performed after

notifying the department but before completion of the permanent closure or changing a storage tank system to a non regulated use. (b) Permanent Closure. To permanently close a storage tank system, owners and/or operators shall empty and clean it by removing all liquids and accumulated sludges and performing a Minimum Site Assessment as defined in Section 29. All USTs taken out of service permanently shall also be removed from the ground or filled with an inert solid material. The tank cleaning and closure procedures shall be properly conducted in accordance with one of the following industry standards or practices: (i) API Recommended Practice 1604, "Removal and Disposal of Used Underground Petroleum Storage Tanks"; (ii) API Publication 2015, "Cleaning Petroleum Storage Tanks"; (iii) API Recommended Practice 1631, "Interior Lining of USTs"; (iv) The National Institute for Occupational Safety and Health "Criteria for a Recommended Standard *** Working in Confined Space"; and, (v) Section 33 provides a process for evaluating and permitting designs or procedures which deviate from recognized industry standards or practices. (c) Change of Service. Before converting any regulated storage tank to store a non regulated substance, owners and/or operators shall empty and clean the tank by removing all liquid and accumulated sludge in accordance with Section 31(b)(i) through (v) unless the non regulated substance happens to be the same as the regulated substance. Before converting any regulated storage tank to store a non-regulated substance, owners and/or operators shall conduct a Minimum Site Assessment in accordance

17-64

(d) Records. Results of the Minimum Site Assessments required under this section shall be submitted to the department

with Section 29.

within ninety (90) days of completion.

Section 32. Applicability to Previously Closed or Abandoned Storage Tank Systems.

- (a) UST systems permanently closed after December 22, 1988 and AST systems permanently closed after the date of these regulations, shall comply with the state requirements for closure by either removing the storage tank system from the ground or permanently closing it in place in accordance with Section 31 and 33.
- (b) When directed by the administrator, the owner and/or operator of a storage tank system or an owner of a site upon which such a system was located that was permanently closed before the effective date of these regulations shall accomplish a Minimum Site Assessment in accordance with Section 29. When directed by the administrator, abandoned storage tank systems shall be permanently closed in accordance with Sections 31 and 33. The administrator may take action under this section if the department determines that releases from the storage tank system may pose a current or potential threat to human health and/or the environment. Owners and/or operators of UST systems permanently closed before December 22, 1988, shall have complied with the practice of API Bulletin No. 1604, Recommended Practice for Abandonment or Removal of Underground Tanks.

STORAGE TANK SYSTEMS:

TECHNOLOGY AND PROCEDURES NOT SPECIFICALLY AUTHORIZED

Section 33. General. This part is provided to encourage new technology, procedures, or equipment that are not specially authorized, and provide a process for evaluating and authorizing those that deviate from the regulations in this chapter. The proposed use of technologies, systems, or processes not in compliance with these regulations will be authorized provided that they function or comply with the intent or purpose of this chapter.

- (a) Application Contents. Each application for authorization to utilize new technology, systems, or processes under this section shall be evaluated on a case-by-case basis using the best available scientific information. The following information shall be included with a written application to the department for review and authorization:
- (i) Data obtained from a full scale, comparable installation or process which demonstrates compliance with the intent or acceptability of the technology, or;
- (ii) Data obtained from a pilot project operated under the design condition for a sufficient length of time to demonstrate the acceptability of the design, or;
- (iii) Data obtained from a theoretical evaluation of the technology or procedure which demonstrates a reasonable probability of compliance with the intent of this chapter, and;
- (iv) An evaluation of the flexibility of making corrective changes in the event the technology or process does not function as planned.
- (b) Pilot facility. If an applicant wishes to construct a pilot facility, to demonstrate a particular technology or to generate the data necessary to prove the technology, a permit to construct under Chapter 3, Wyoming Water Quality Rules and Regulations shall be obtained prior to construction.

PART I

AST SYSTEMS

Section 34. Tanks Covered by this Part. This part covers all ASTs that meet the requirements found in W.S. 35-11-1415(a)(xi).

Section 35. Construction requirements for AST Systems.

- (a) Tanks. All tanks regulated by this part, whether existing or new, shall be welded steel tanks. Bolted or riveted steel tanks or tanks made of any material other than steel shall not be used as a regulated AST after the effective date of these regulations. After the effective date of these regulations, no tank intended for use as an UST shall be installed as an AST.
- (b) Secondary Containment. All ASTs regulated under this section shall be constructed with secondary containment equal to at least 110% of storage capacity of the largest single AST within the secondary containment wall. The owner and/or operator of any AST shall control runoff captured inside the secondary containment system and insure that runoff is free of floating oils prior to discharge from the secondary containment structure. Secondary containment shall be constructed of materials that are:

(i) Fireproof;

- (ii) Compatible with the regulated substance stored.
- (c) Vehicle impact protection. All ASTs regulated under this section shall be protected against vehicle impact by barriers. Barriers are required on any side subject to impact by a vehicle traveling on any surface accessible to the public. Barriers shall meet one of the following specifications:
- (i) Guard posts constructed of steel no less than four (4) inches in diameter and concrete filled, spaced not more than four (4) feet apart, and set not less than three (3) feet above ground in a concrete filled footing 15 inches minimum diameter and a minimum of three feet deep. Posts shall not be located less than five (5) feet from the tanks.
- (ii) Concrete secondary containment walls if the wall is at least five (5) feet from the tanks, and extends at least three (3) feet above ground level on the outside of the structure, and

contains a minimum of two 5/8 inch reinforcing rods placed in the
concrete as a continuous band within one foot of the top of the
structure. Secondary containment structures constructed of
concrete block, lightweight steel, or earth do not meet this
requirement. Concrete secondary containment structures which do
not meet this requirement may be approved by the department on a
case by case basis.
(iii) Concrete barriers constructed to DOT
specifications for use as a barrier along highways. These barriers
are commonly called "jersey barriers".
(iv) UL-2085 tanks do not require separate vehicle
impact protection, provided that the manufacturer certifies that
the tank provides vehicle impact protection.
The contract of the contract o
(d) Corrosion protection. All AST systems regulated under
this section shall be protected against corrosion using one of the
following methods:
(i) A sacrificial anode CP system. Such systems shall
be checked annually for proper operation by a CP tester, and shall
be designed by a corrosion expert. Owners and/or operators of all
ASTs protected by sacrificial anode systems shall also comply with
Section 11 of this Chapter;

to enable the owners and/or operators to monitor the operation of the CP system. (ii) All CP systems installed on ASTs shall be installed, inspected and maintained to meet or exceed one or more of the following industry standards and practices: (A) NACE Standard RP0193 2001, "External Cathodic Protection of On-Grade Carbon Steel Storage Tank Bottoms"; (B) NACE Standard RP0285 2002, "Control of External Corrosion on Metallic Buried, Partially Buried, or Submerged Liquid Storage Systems".; or (C) API Recommended Practice 651, "Cathodic Protection of Aboveground Storage Tanks." (f) Overfill protection. All ASTs regulated under this section shall have overfill protection as follows: (i) systems shall sound an audible or visible alarm at the filling rack when the AST is 90% full; (ii) systems shall close valves and prevent overfilling the tank before the AST is 95% full; and (iii) For tanks larger than 100,000 gallons, the following shall also be provided: a system shall sound a second audible and visible alarm at the filling rack when the AST is 95% full. (g) Spill prevention. All AST Systems regulated under this section shall have spill prevention equipment as follows: (i) all fill lines shall be protected with a double check valve to prevent backflow from the tank and a self closing fire valve, activated by a frangible, fusible link; (ii) the fill lines shall be completely enclosed within the secondary containment system; or (iii) each fill line shall have its own system to control spillage. (h) Connected Lines. All underground pipe lines connected to

ASTs regulated under this section shall be non-corrodible, double

walled lines equipped with working leak detection equipment. All
above ground lines shall be steel. All connections between above
ground lines and underground lines shall be made inside accessible
leak proof sumps.
<u>-</u>
(i) Applicable Standards for new ASTs. All new AST systems
installed after the date of these regulations must meet the
requirements of one or more of the following industry standards or
practices:
Practices
(i) Field Constructed Steel Tanks.
(1) Tieta comperacea pecer ramp.
(A) API Standard 12D, "Specification for Field
Welded Tanks for Storage of Production Liquids";
werded failed for Scorage of Froduction diquids /
(B) API Standard 620, "Design and Construction of
Large, Welded Low-Pressure Storage Tanks";
targe, werded how-rressure scorage ranks /
(C) API Standard 650, "Welded Steel Tank for Oil
Storage";
(D) NFPA Standard 30, "Flammable and Combustible
Liquids Code";
(E) NFPA Standard 30A, "Motor Vehicle Fueling
Stations and Repair Garages Code";
(=)
(F) API Standard 653, "Tank Inspection, Repair,
Alteration, and Reconstruction";
(G) PEI Recommended Practice 200 2003, "Recommended
Practices of Installation of Aboveground Storage Systems for Motor
Vehicle Fueling"; and/or
(H) Other standards approved by the department.
(ii) Shop Constructed Tanks.
(A) UL 2085, "Protected Aboveground Tanks for
Flammable and Combustible Liquids;
(B) UL 142, "Standard for Aboveground Flammable
and Combustible Liquid Storage Tanks"; or

(C) API Standard 650 Appendix J, "Shop-Assembled Storage Tanks"; (D) NFPA Standard 30, "Flammable and Combustible Liquids Code"; (E) ASME, "Boiler & Pressure Vessel Code, Section VIII, Division 1, Design and Fabrication of Pressure Vessels (F) API Standard 653, "Tank Inspection, Repair, Alteration, and Reconstruction"; (G) PEI Recommended Practice 200-2003, "Recommended Practices of Installation of Aboveground Storage Systems for Motor Vehicle Fueling"; (j) ASTs installed after the effective date of these regulations. (i) ASTs installed after the effective date of these regulations shall have a suitable foundation capable of supporting the tank full of the regulated substance without excessive differential settlement as defined in API Standard 653 or the manufacturer's recommendation. The foundation shall be designed by a Registered Professional Engineer, licensed in the State of Wyoming. The foundation design shall provide positive drainage of water away from the base. ASTs located in areas subject to flooding shall be anchored to prevent flotation. (ii) All ASTs installed or re installed after the date of these regulations shall meet all the requirements of Part I before being placed in service. (iii) All ASTs installed after the effective date of these regulations shall be placed on a release prevention barrier. The integrity of the barrier shall not deteriorate due to exposure to the elements or soil in the presence of regulated substances. The following are acceptable release prevention barriers: (A) An impermeable geosynthetic clay liner with a permeability of 10⁻⁶ cm/sec or less; (B) An impermeable geosynthetic liner installed in

accordance with manufacturer's recommendations such as a 60 mil unreinforced liner or a 40 mil reinforced liner, or a material of

similar or more stringent specifications that is compatible with
the regulated substance stored;
(C) A double bottom tank equipped with a leak
detection system that will detect the presence of the regulated
substance in the space between the bottoms; or
(D) For tanks of less than 100,000 gallons
capacity, an impermeable reinforced concrete slab.
(E) For double walled, vaulted tanks with an
interstitial monitoring device, the tank structure meets, by
itself, all requirements for both the secondary containment and
the release detection barrier.
(iv) The owner and/or operator of every field
constructed AST installed after the effective date of these
regulations shall keep on file for the life of the tank, and make
available to the department upon request, the following baseline
data:
(A) Floor and wall/shell thickness
measurements;
(B) Material certifications for all materials
used in the construction of the AST system, including secondary
containment and release prevention barriers; and
(C) A report including welding procedures,
welding certification reports, and any non destructive testing
performed on the AST.
(v) The owner and/or operator of all shop
fabricated ASTs installed after the effective date of these
regulations shall keep on file and make available to the department
on request:
(A) the floor and wall/shell thickness
measurement if a UL label does not exist on the tank; and
(B) material certifications for all materials
used in the construction of the entire AST system.
<pre>(vi) All exposed exterior surfaces of all field</pre>
constructed ASTs installed after the effective date of these

regulations shall be protected against corrosion. For surfaces that are visible with the tank in operation, this requirement may be met using field applied coatings that are compatible with the stored regulated substance.

(vii) The completed installation of all metallic Field Constructed ASTs installed after the effective date of these regulations shall be inspected and certified by a certified API 653 inspector.

(viii) The owner and/or operator of any shop fabricated AST shall keep on file for the life of the AST and provide to the department on request, a report including welding procedures, welding certification reports, and any non destructive testing performed on the AST.

(ix) The owner and/or operator of every AST installed after the effective date of these regulations shall provide a certificate of installation to the department that meets the requirements of Section 6(e) of this chapter.

(k) Existing ASTs. Tanks do not need to be UL labeled but must be designed, constructed, and tested to the approved standards. Non-UL labeled tanks shall bear an all weather label with the following information: name and address of the tank manufacturer, year the tank was built or date of re certification, capacity of the tank in US gallons, and the tank construction or inspection standard used. Existing ASTs must meet the substantial requirements of Section 35 no later than October 1, 2008.

(1) Operational venting. Normal operation vents are required to prevent the development of vacuum or pressure within ASTs. Such vents shall be sized in accordance with IFC 3404.2.7.3 and shall be at least the size of the fill or withdrawal connection but not less than 1 and 1/4 (one and one quarter) inches inside diameter. Flammable liquid vents must terminate not less than twelve (12) feet above grade and five (5) feet from a building opening or property line. They must discharge upwards and outward. Operational venting shall comply with API 2000, NFPA 30, UL 142 and UL-2085 as applicable.

(m) Emergency venting. Each AST shall be equipped with adequate additional emergency venting that will relieve excessive internal pressure caused by fire exposure. Emergency venting shall comply with API-2000, NFPA 30, UL-142 and UL-2085 as applicable.

- (n) Warning signs. Signs, placarding of product and no smoking signs shall be properly posted in accordance with IFC 3404.2.3.2, 3404.2.3.2 and 3403.5.
- (o) Upgrading existing tanks. All existing ASTs that do not meet the requirements of this chapter must be upgraded no later than October 1, 2008, to meet all of the requirements of this chapter for new ASTs.
- (p) Fire Marshall plan review. All AST systems installed or modified after the date of these rules shall provide documentary proof to the department that the plans have been reviewed and passed by the appropriate authorizing authority under the State Fire Marshall. This "plan review" insures compliance with the applicable fire code as adopted into Wyoming State Statutes.
- (q) Installation and modification inspections. AST system upgrades required by this part shall be inspected by the Water Quality Division.
- (r) Access to tank tops. Access shall be provided to the top of all ASTs for inspection of venting, overfill equipment and other required equipment. Access shall be by way of permanently mounted, solidly constructed, non-combustible ladders, stairs, catwalks and platforms which comply with Occupational Safety and Health Administration standards.
- (s) Tank openings. No AST regulated under this section, which is eleven (11) feet high or less, shall be connected to piping through any opening in a location other than the top. This means that all fill lines and product delivery lines must exit the tank through the top. All lines shall be equipped with anti-syphon devices. ASTs which are higher than eleven (11) feet high, and have penetrations near the bottom of the tank shall be equipped with internal fire valves on all openings which are not in the top of the tank.
- (t) Emergency switches. Emergency disconnect switches shall be provided at prominent locations to stop the transfer of fuel to the fuel dispenser in the event of a spill or other emergency. These switches shall be within one hundred (100) feet but not less than twenty (20) feet of dispensers. All emergency disconnect switches shall be labeled: "EMERGENCY FUEL SHUT OFF" using a

durable, weatherproof, sign with letters a minimum of 6" (six inches) high.

- (u) Direct connection between USTs and ASTs. Any existing UST directly connected to an AST must have an automatic tank gauging system equipped with an audible and visual alarm system which will sound when the underground tank is 95% full or automatically shut off the flow to the UST when the UST is 95% full. This system shall be separate from any control system which controls the filling of the UST. After the effective date of these regulations no new connection shall be made between any UST and any AST.
- (v) Repairs. Repairs to ASTs shall be performed in accordance with Section 8 of this chapter.
- (w) Submerged ASTs. After the effective date of these regulations, no AST shall be operated submerged in water.
- (x) Site Security. All ASTs shall be protected from vandalism and unauthorized product release by security fencing. Security fences shall be galvanized wire mesh no less than six (6) feet high topped with three (3) strands of barbed wire on an angled support bracket. Fencing shall be no less than five (5) feet from any of the tanks within the secondary containment structure. At facilities where wire fencing is not allowed by any other authority, the owner/operator may substitute other types of fencing at least six (6) feet high.

Section 36. AST Leak Detection Requirements.

- (a) Methods. No later than October 1, 2008, all owners and/or operators of ASTs covered by this chapter shall provide leak detection for the tank itself using one of the following methods:
- (i) Automatic tank gauging. All owners and/or operators of ASTs using this method shall conduct Automatic Tank Gauging in accordance with Section 16(c) of this chapter. All automatic tank gauges used for above ground tanks must be third party certified to meet this requirement in an above ground storage tank application.
- (ii) Manual Tank Gauging. Owners and/or operators of ASTs with a capacity of less than 1,320 gallons may be monitored using manual tank gauging as defined by Section 15(a).

- (iii) Interstitial Monitoring. Owners and/or operators of ASTs that were constructed under the UL 2085 standard shall monitor the interstitial space between the inner tank and the outer shell. Records shall be kept showing the date of the monitoring, the name of the person doing the monitoring and the results. An automatic system that monitors this method shall be printed out monthly and kept for three (3) years;
- (iv) Visual Monitoring of Tank Bottoms. Owners and/or operators of ASTs that are elevated above ground where the entire surface of the tank is visible from beneath shall monitor the tanks monthly for visible signs of leakage. Records of these inspections shall be made showing the date of the inspection, the name of the person doing the inspection, and any sign of leakage noted. Records shall be kept by the owner and/or operator for three (3) years;
- (v) Passive Acoustic Sensing. Owners and/or operators of ASTs using this method shall be equipped with a continuous sensing system capable of detecting a release of .2 gallons per hour or a release of 150 gallons per month with a probability of detection of .95 and a probability of false alarm of 0.05. All passive acoustic sensing systems shall produce a written record showing that the system is on and operable. All passive acoustic sensing systems shall be calibrated annually;
- (vi) Tracer Surveys conducted on a monthly basis in accordance with Section 16(h) of this Chapter; or
- (vii) Other methods approved in accordance with Section 16(j) of this Chapter.
- (b) ASTs larger than 100,000 gallons. Owners and/or operators of ASTs with a capacity of 100,000 gallons or more shall follow the inspection requirements of API standard 653.
- (c) SPCC Plans. Owners and/or operators of any single AST or combination of more than one AST, with a capacity of 1,320 gallons or more, must have a Spill Prevention Control and Countermeasures (SPCC) plan on file with the department. This is the same document required by the Environmental Protection Agency under 40 CFR 112.
- (d) Additional requirements for large facilities. Facilities with above ground capacity of 100,000 gallons or more shall provide

at least one additional leak detection method beyond the requirements for Section 36(a). Such methods may be custom designed for the facility at the option of the owner and/or operator, or may be a second method named in Section 36(a). Department approval is required before implementing methods in compliance with this section.

- (e) Inventory Control. All owners and/or operators of ASTs shall conduct inventory control in accordance with Section 16(a). This does not meet the additional requirement imposed by Section 36(d).
- (f) Operator's Annual Inspection. Owners and/or operators of ASTs shall conduct an annual inspection of all AST systems in accordance with Section 13(e).

Section 37. Leak Detection Requirements for Underground Lines Connected to ASTs.

- (a) Sump Sensors. Owners and/or operators shall provide for leak detection using sump sensors to monitor the space between the double wall systems. Sump sensors shall be wired to shut down all pumps and dispensers in the event of an alarm. On an annual basis, the owners and/or operators shall trip all sump sensors and record that they shut down the pumps and dispensers as required; or
- (b) Automatic Line Leak Detectors. Owners and/or operators shall provide pressurized piping and automatic line leak detectors. Pressurized piping shall meet all of the requirements found in Section 14(g)(i).
- (c) Suction Piping with single wall pipe. Owners and/or operators shall not use suction systems with single walled pipe on AST Systems after October 1, 2008.

PART J

ENVIRONMENTAL RESTORATION STANDARDS FOR LEAKING STORAGE TANK REMEDIATION ACTIONS

Section 38 Soil Remediation.

Soil remediation criteria shall be based on the evaluation of two
(2) aspects. The first aspect is the potential to contaminate
existing groundwater quality. Groundwater quality impact will be
accomplished by evaluating the subsurface fate and transport
characteristics of the regulated substance using unique site soil
conditions. Secondly, potential adverse public health impacts
will be evaluated using an environmental risk assessment process
for contaminated soil ingestion and inhalation.
Section 39. Water Quality Standards.
(a) Surface Water. Storage tank program remediation
actions shall protect surface water quality to the standards
contained in Chapter 1, Wyoming Water Quality Rules and
Regulations, Quality Standards for Wyoming Surface Waters.
(b) Groundwater. Storage tank program remediation actions
shall protect:
(i) All Class I, II, III, IV(a), IV(b) or Special A
groundwater quality to the most stringent of the:
(A) federal primary MCL contained in 40 CFR 136
as of the date of this chapter,
(B) water quality standards contained in this
section when there is no federal MCL for a substance; or
(C) groundwater quality standards found in Chapter
8, Wyoming Water Quality Rules and Regulations, Quality Standards
for Wyoming Groundwaters.
101 Myoming Groundwaters.
(D) cleanup of groundwater which is Class I
groundwater by use, shall address contaminants in the groundwater
which originated from the storage tanks system. Cleanup of
parameters which are naturally occurring, or are from sources

other than	the storage tank system, which do not meet the
standards fo	or Class I groundwater shall not be accomplished.
	ii) All class VI groundwater to the groundwater
_	ndards found in Chapter 8, Wyoming Water Quality Rules
and Regulat:	ions, "Quality Standards for Wyoming Groundwaters."
	ree Product. Whenever any free phase liquid layer of a
_	ubstance is encountered in groundwater or floating on
_	ater surface with a thickness in excess of 0.05
	toration shall begin as soon as possible to remove the
	ubstance(s) and prevent contaminant migration into
previously a	uncontaminated areas.
(d) D:	rinking Water Equivalent Levels. For those chemical
substances 	where a MCL does not exist and where there is no
	either Chapter 1 or 8, Wyoming Water Quality Rules
and Regulat:	ions, the following procedures will be used to
calculate a	state Drinking Water Equivalent Level (DWEL).
Because sto	rage tank remediation actions may require several
years to con	mplete and since groundwater quality in Wyoming shall
be protected	d as a potential drinking water source(s), these
calculation	s will be based on chronic exposure.
	(i) Non-carcinogenic substances:
	$DWEL = \frac{(RfD_0)(ABW)(HQ)}{(DWI)(AB)(FOE)} $ (Equation 1)
	(ii) Carcinogenic substances:
j	$DWEL = \frac{(RISK)(ABW)(LIFE)}{(CPF_0)(DWI)(AB)(FOE)(DUR)}$ (Equation 2)
where;	
	Drinking water equivalent level, mg/L.
RISK =	Cancer risk for drinking water, (1 x 10 6).
ABW =	Average adult body weight over exposure period
	(70 kg).
<u> </u>	Oral cancer potency factor (mg/kg-day)-1; chemical
	specific.
RfD₀ =	Oral reference dose (mg/kg day); chemical
-	specific.
———————	Adult drinking water intake, 2 L/day.

AB = Gastrointestinal absorption rate (1.0).

LIFE = Lifetime (70 years).

DUR = Duration of exposure (30 years).

FOE = Frequency of exposure, (350 days/365 days = 0.96).

HO = Hazard quotient (1).

Values for oral toxicological reference doses (RfD₀) and/or cancer potency factors (CPF₀) will be obtained from current data in the U.S. Environmental Protection Agency's Integrated Risk Information System (IRIS), the EPA Health Effects Assessment Summary Tables (HEAST) toxicity data sources, or the EPA Region IX Preliminary Remediation Goals Data Base. If an oral reference dose or cancer potency factor is not listed in the above data base sources, the administrator will determine a state DWEL using the latest available toxicological data.

(e) When more than one standard exists in the above sections for any parameter, the most stringent standard shall be used.

Section 40. Soil Human Health Risk Assessment Calculations.

(a) Introduction. A risk assessment for potential human health impacts is required for storage tank remediation actions to evaluate the risk component from a release and to develop quantitative soil cleanup concentrations directly related to the environmental risk. The human health risk assessment model is based on existing EPA methodologies and exposure constant values. The routes of potential exposure are soil ingestion and inhalation from volatile organic hydrocarbons and total petroleum hydrocarbons.

(b) Risk Assessment Calculation Model. With the soil properties data collected during the subsurface investigation and/or extended remedial design investigation phases, site specific soil risk assessment calculations shall be made using equations in this section. This model estimates chronic exposure(s) on a site specific basis by combining an average exposure point concentration with reasonably conservative values for human intake and exposure duration. Thus, all site specific soil parameters used to calculate risk assessment remedial concentrations at each site should reflect average or typical site conditions. In addition to site specific soil conditions

and chemical compounds, default values have been established for other equation input parameters.

(i) Combined Oral Ingestion and Inhalation Exposures to Carcinogenic Contaminants in Residential Soil:

$$----C_{s}(mg/kg) = \frac{(RISK)(AT_{c})}{EF\left(\frac{(IFS_{adj})(CPF_{o})}{10^{6}mg/kg} + \frac{(INHF_{adj})(CPF_{i})}{VF_{s}}\right)} + \frac{(Equation 3)}{(Equation 3)}$$

(ii) Combined Oral Ingestion and Inhalation Exposures to Non-carcinogenic Contaminants in Residual Soil:

-where:

$$----VF_S(m^3/kg) = (Q/C) \left(\frac{10^{-4}(m^2/cm^2)\sqrt{\pi(D_A)(T)}}{(2)(\rho_b)(D_A)} \right) - (\text{Equation 5})$$

and;

$$D_{A} = \frac{\left(\phi_{a}^{10/3}\right)(D_{i}H') + (\phi_{w}^{10/3})(D_{w})}{n^{2}\{(\rho_{b})(K_{d}) + \theta_{w} + (\phi_{a})(H')\}}$$
 (Equation 6)

-----and;

B₩ _e	_	Body weight, child, 15 kg.
ED ₂		Exposure duration, child, 6 yrs.
IRS _e		Soil ingestion rate, child, 200 mg/d.
IRA		Soil inhalation rate, child, 10 m ³ /d.
RfD -		Reference dose, oral, mg/kg d.
RfD ,		Reference dose, inhalation, mg/kg d.
Q/C		Inverse of the mean concentration at the
~/ -		center of a 0.5 acre square source in
		Wyoming, 100.13 (g/m² s per kg/m³).
——————————————————————————————————————	=	Apparent diffusivity, cm ² /s.
——————————————————————————————————————	=	Chemical diffusivity in air, cm²/s, chemical
- +		specific.
——————————————————————————————————————		Chemical diffusivity in water, cm²/s,
— w		chemical specific.
Т	=	Exposure interval, s, 9.5E08.
		Soil density, g/cm³, 1.5 or actual value.
	_	
	=	Soil particle density, g/cm³, 2.65.
——————————————————————————————————————		Air filled soil porosity, Lair/Lsoil, 0.28 or,
		n — 0
Θ,,		Water filled soil porosity, L _{water} /L _{soil} , 0.15.
n		Total soil porosity, L _{bore} /L _{soil} , 0.43 or, 1
11		
— Н/		$\frac{(\rho_{\rm b}/\rho_{\rm e})}{(\rho_{\rm b}/\rho_{\rm e})}$
	=	Dimensionless Henry's Law constant, H(41),
TZ.		chemical specific.
K _d	=	Soil water partition coefficient cm ³ /g, K _{ee} f _{ee} ,
77		chemical specific.
K ee	=	Soil organic carbon water partition
£		coefficient, cm³/g, chemical specific.
T ee	=	Fraction organic carbon in soil, g/g, 0.001
		or site specific value.

Values for oral toxicological reference doses (RfD_o) and/or oral cancer potency factors (CPF_o) are obtained from current data in the U.S. Environmental Protection Agency (EPA) Integrated Risk Information System (IRIS), the EPA Health Effects Assessment Summary Tables (HEAST), or the EPA Region IX Preliminary Remediation Goals Data Base. If an oral reference dose or cancer potency factor is not listed in the above data base sources, the administrator will determine an acceptable soil cleanup concentration using the latest available toxicological information from other appropriate sources.

Section 41. Soil Environmental Fate and Transport Evaluation.

(a) Conceptual organic compound fate and transport model.

(i) The model is based on the following set of assumptions:

(A) A finite amount of soil contamination exists
at variable depths beneath a leaking storage tank site. It may
extend from the surface to below the groundwater table, or it may
be confined to a discrete zone. There is an uppermost aquifer
beneath the site which is not adequately protected by an
impermeable barrier between the contaminated soil and the
aquifer. Percolating rainfall, or snow melt, moves through the
contaminated soil, mobilizes some of the contamination as a
leachate and carries the contamination towards the aguifer. A
portion of the contamination remains strongly adsorbed to the
soil. The portion of the contaminants that are not permanently
adsorbed are available for biodegradation and a limited amount of
leaching.
(B) The point of compliance for protecting
groundwater quality is directly below the contaminated soils at
the surface of the aquifer.
<u>-</u>
(C) The rate of leaching from the soil has
reached a steady state.
(D) The soils beneath the leaking storage tank(s)
represent the only source of contamination to the groundwater.
(E) Vapors emanating from the contaminants in the
soil are moving primarily upwards to the ground surface, and
there is no perched saturated zone above the contaminated soils.
Based on existing program experience, the potential does exist
for some lateral movement of contaminant vapors; however, this
movement is not the primary direction.
(F) A leachate plume beneath the contaminated
zone has not yet reached the groundwater table.
(ii) The model for calculating soil cleanup
concentrations involves a set of mathematical equations designed
to calculate soil remediation concentrations. The equations have
been modified and simplified to make it possible to calculate
soil cleanup concentrations using as much site specific
data/information as possible. The site specific data that are
used in the equations should be available from the subsurface
investigations and are preferred over using the default values.
J
(iii) The equations are a mathematical expression
of the conceptual model. The organic contaminant concentration

in the soil is reduced by a fractional amount that has been biodegraded by natural bacteria in the soil system. Therefore, a biodegradation factor, e^{-kt} , has been included in the evaluation process. Because the biodegradation factor will reduce the amount of contaminant available for leachate generation, the soil cleanup concentration can be adjusted upward by a calculated amount. The amount, which is adsorbed, is calculated using the chemical specific adsorption coefficient, K_d .

 $\frac{}{}$ (iv) The adsorption coefficient, $K_{d},$ is calculated from the following equation using site specific data:

$\frac{K_d = (f_{oe})(K_{oe}) \qquad (Equation 7)}{}$
where,
$\underline{f_{oc}}$ = site specific fraction of organic carbon, mg
organic carbon/mg soil in the uncontaminated subsurface site soil. Normal range of foe in the uncontaminated wyoming soils is 0.1-3%. If a site specific for the specific value of 0.1%.

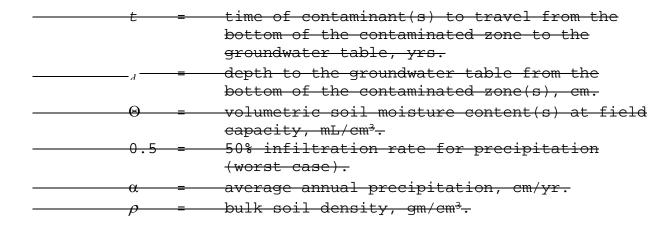

(v) The conceptual model discussed above is
represented by the following series of equations with further
explanation, as necessary:

(A) Determine travel time to reach groundwater table, t.

(1) Subsurface soil contamination separated from the groundwater table by more than one (1) foot of depth is calculated as follows: Because subsurface organic carbon content below one foot is expected to approach a very low number in Wyoming soils, the following contaminant travel time equation has been developed:

$$-t = \frac{(d)[(K_d)(\rho) + \theta]}{0.5(\alpha)}$$
 (Equation 8)

— where,

(2) If more than one soil type exists at a contaminated site or remediation project location where the organic carbon content differs by 0.5% or greater and the different soil type is one foot or greater in thickness, individual soil type specific values for K_d , Θ , and ρ shall be used in the time of travel calculation for each soil type. Further, the individual values for depth, d, to the groundwater table from the bottom of each contaminated soil type zone shall be used in the calculation. If the depth, d, from the bottom of the contaminated soil type zone to the groundwater table is less than twelve (12) inches, this method for determining contaminated soil remediation concentrations is not valid. In these cases, cleanup of contaminated groundwater will govern the satisfactory remediation of contaminated soil within this 12 inch interval. The final time of travel, t, is the sum of the individual soil type segments.

(3) Surface contamination extending from the ground surface to depths greater than two (2) feet. In order for the following equation to be used, the subsurface soil within the two (2) foot distance must contain at least three (3) percent total organic carbon, otherwise equation 8 applies for the time of travel calculation. While using two (2) different K_d -values for different soil organic carbon concentrations, the equation is derived in the same manner as

$$t = \frac{(z)[(\kappa'_d)(\rho') + \theta'] + (d)[(\kappa_d)(\rho) + \theta]}{0.5(\alpha)}$$
 (Equation 9)

where, thickness of soil containing three (3) percent or greater organic carbon, cm. adsorption coefficient in the top two (2) feet of soil which is equal to the measured fraction of organic carbon, for, times the Koc value soil adsorption coefficient in the remaining soil column calculated from Equation 7, mL/qm. bulk soil density of soil containing three (3) percent or greater organic carbon, qm/cm³. volumetric soil moisture content at field capacity of soil containing three (3) percent or greater organic carbon, mL/cm³.

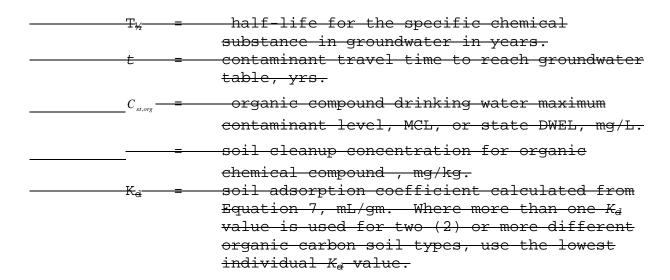

The parameter, Z, takes into account natural organic carbon which may be present at the ground surface, and it may extend for a limited vertical distance [. 0-60 cm (0-24 inches)] into the ground. Development of site specific soil adsorption coefficient isotherms may be required for complex surface environments where f_{oe} is greater than three (3) percent. If the uppermost two (2) foot zone contains less than three (3) percent natural organic carbon, the Z portion of the time of travel calculation drops out, thus leaving equation 8 to apply for the time of travel calculation. This portion of the calculation provides a mechanism to account for higher surface contaminant adsorption by naturally occurring organic carbon within this zone.

(B) Calculate the soil remediation concentration for the biodegradation potential, Compound(s) using the following derived equation:

$$----C_{s,org} = \frac{(C_{st,org)}(K_d)}{e^{-kt}}$$
 (Equation 10)

---where,

 $k = biodegradation rate constant, 0.693/T_k, 1/yr.$

Equation 10 establishes the leaking storage tank site soil remediation concentration for each organic chemical compound which could be allowed to remain in soil without threatening degradation of groundwater quality even if groundwater seasonally passes through the contaminated zone.

(vi) The soil saturation limit is the contaminant concentration at which soil pore air and pore water are saturated with the chemical and the adsorptive limits of the soil particles have been reached. Above this limit, the contaminant may be present in the free phase. Equation 11 is used to calculate the soil saturation limit for each organic chemical at leaking storage tank sites.

$$C_{sat} = \frac{S(K_a \rho_b + \theta_w + H' \theta_a)}{\rho_b}$$
(Equation 11)

(b) Conceptual Metal, Inorganic Compound, and Total Petroleum Hydrocarbon Fate and Transport Model.

The conceptual model for metals, inorganic compounds, and total petroleum hydrocarbons (TPH) assumes that these substances are distributed in subsurface soils around, or below, the level of a storage tank which had contained leaded regular gasoline or a hazardous substance. Some of these substances will be mobilized in percolating rainfall, or snow melt, and may be transported to the groundwater table as a leachate. That portion of these substances which remains adsorbed to the soil particles is

determined by the adsorptive properties of both the substance and soil. It is calculated using the adsorption coefficient, K_d . The factor, e^{it} , is used as a leaching rate factor in this model to determine the rate at which leachate is released from the contaminated soil.

The conceptual model for metals, inorganic compounds, and TPH is represented by the following series of equations.

- (i) Determine the leaching rate constant, λ .

$$\lambda = \frac{(0.5)(\alpha)}{(\Theta)(\tau)(1 + \frac{\rho(K_d)}{\theta})}$$
 (Equation 12)

where,

If more than one soil type exists at a contaminated site where the organic carbon content differs by 0.5% or more and the different soil type is one foot or greater in thickness, individual specific soil type values for K_{d-1},Θ and ρ shall be used in the leaching rate constant calculation for each soil type. The final leaching rate constant, λ , is the sum of the individual soil type segments.

(ii) Calculate travel time to reach groundwater table,

(A) Subsurface soil contamination separated from the groundwater table by more than one (1) foot is handled in the following way:

Because subsurface organic carbon content below one foot is expected to approach a very low number in Wyoming soils, contaminant travel time is calculated by:

$$t = \frac{(d)[(K_d)(\rho) + \theta]}{0.5(\alpha)}$$
 (Equation 13)

where,
$$t = \text{ time of contaminant to travel from the bottom of the contaminated zone to the groundwater table, yrs.}$$

$$d = \text{ depth to the groundwater table from the bottom of the contaminated zone, cm.}$$

$$\Theta = \text{ volumetric soil moisture content at field capacity, mL/cm}^2.$$

$$0.5 = 50\% \text{ infiltration rate for precipitation (worst case).}$$

$$\alpha = \text{ average annual precipitation, cm/yr.}$$

If more than one soil type exists at a contaminated site where the organic carbon content differs by 0.5% or greater and the different soil type is one foot or greater in thickness, individual soil type specific values for $K_{\hat{\sigma}}$, Θ , and ρ shall be used in the time of travel calculation for each soil type. Further, the individual values for depth, d, to the groundwater table from the bottom of each contaminated soil type zone shall be used in the calculation. If the depth, d, from the bottom of the contaminated soil type zone to the groundwater table is less than twelve (12) inches or groundwater travel fluctuates this distance, this method for determining contaminated soil remediation concentrations is not valid. In these cases, cleanup of contaminated groundwater will govern the satisfactory remediation of contaminated soil within this 12 inch interval. The final time of travel, t, is the sum of the individual soil type segments.

bulk soil density, qm/cm3.

(iii) Calculate the soil remediation concentration for the leaching potential of the metal, inorganic compound, or TPH using the following derived equation:

$$C_{s,inorg} = \frac{(C_{stm})^{(K_d)}}{e^{-\lambda t}} \quad \text{(Equation 14)}$$

$$C_{s,inorg} = \frac{\text{soil cleanup concentration due to metal,}}{\text{inorganic compound, or TPH leaching potential, mg/kg.}}$$

$$C_{stm} = \frac{\text{environmental standard concentration,}}{\text{primary MCL, or state DWEL, mg/L.}}$$

$$C_{stm} = \frac{\text{chemical leaching rate, 1/yr.}}{\text{contaminant travel time to reach groundwater table, yrs.}}$$

$$K_d = \frac{\text{soil metal, inorganic compound, or TPH adsorption coefficient, ml/gm.}}$$

The soil cleanup concentration for metals, inorganic compounds, or TPH is determined by evaluating the above calculations and the natural background concentration. Information concerning the natural subsurface concentration may be available from either (1) a subsurface investigation report, or (2) site specific subsurface soil samples from an uncontaminated, up-gradient location immediately near the leaking storage tank site shall be collected and analyzed for the appropriate constituent. Soil metal remediation is not required for concentrations that are below natural background concentration(s).

(c) Final Storage Tank Cleanup Concentration. The final numerical leaking storage tank site soil cleanup concentration for organic chemical compounds shall be the lower numerical value of: the total petroleum hydrocarbon concentration, the human health risk assessment, the soil saturation concentration, and the environmental fate and transport considerations. The final numerical leaking storage tank site soil cleanup concentration value for metals, inorganic compounds, and total petroleum hydrocarbons shall be the lower numerical value of: the environmental fate and transport calculation and the human health risk assessment component. The goal of the final cleanup concentration(s) is to ensure that the remedial action will result in an acceptable cleanup for organic chemical compounds, inorganic compounds, TPH, and metals.

Section 42. Vapor Hazards Evaluation.

(a) Petroleum and/or hazardous substance vapors in either soil, vadose zone, or groundwater resulting from a storage tank release and that has caused, or has a potential to cause, an explosive atmosphere in a private residence, business, or other occupied structure, or in a confined space such as utility conduits, sewer mains, etc., shall be evaluated and remediated according to this section. Monitoring for explosive atmosphere action levels shall be accomplished using a properly calibrated and operating combustible gas meter. Explosive atmosphere action levels for volatile substances are defined as 25% of the substance lower explosive limit (LEL).

When an explosive action level is exceeded, immediate measures shall be taken to reduce the explosive environment below the action level. The immediate action system will be operated and/or maintained until such time as a soil and/or groundwater restoration action(s) has eliminated the explosive atmosphere, or the immediate action system is not required to maintain the environment below the explosive atmosphere action level.

Atmospheric monitoring shall be required for any immediate action system.

(b) After remediation or immediate response, soil or groundwater contamination caused by a storage tank release shall not contain any contaminant concentration which causes a release of vapors to the vadose zone or atmosphere which could present a human health hazard in an indoor structure or confined space where people or animals may work or live and receive an exposure.

Chemical substance airborne concentrations in occupational environments are regulated by Chapter 7, Occupational Health and Environmental Control, General Rules and Regulations, Wyoming Occupational Health and Safety Division, Department of Employment, for protection of employees in a work place.

Hazardous substance indoor air quality action levels will be calculated using the following equations.

(i) Carcinogens:

$$-----IAAL(\mu g/m^3) = \frac{(RISK)(ABW)(LIFE)(UCF)}{(CPF_i)(BR)(ABS)(DUR)}$$
(Equation 15)

$$----IAAL(\mu g/m^3) = \frac{(RfD_i)(ABW)(UCF)(HQ)}{(BR)(ABS)} - \frac{(Equation 16)}{(Equation 16)}$$

where;

Indoor Air Action Level, $\mu g/m^3$.

DICK = Cancer risk (-1 x 10-6).

R/D_ = Inhalation Reference dose; chemical specific.

CPF_i = Inhalation Cancer Potency Factor; chemical specific.

ARW = Average body weight (70 kg).

INCE = Unit conversion factor (1,000 $\mu g/mg$).

BRD = Indoor breathing rate (15 m³/day).

ARG = Absorption percentage (100%).

HQ = Hazard quotient (1).

INCE = Lifetime exposure (70 years).

DUR = Duration of exposure (30 years).

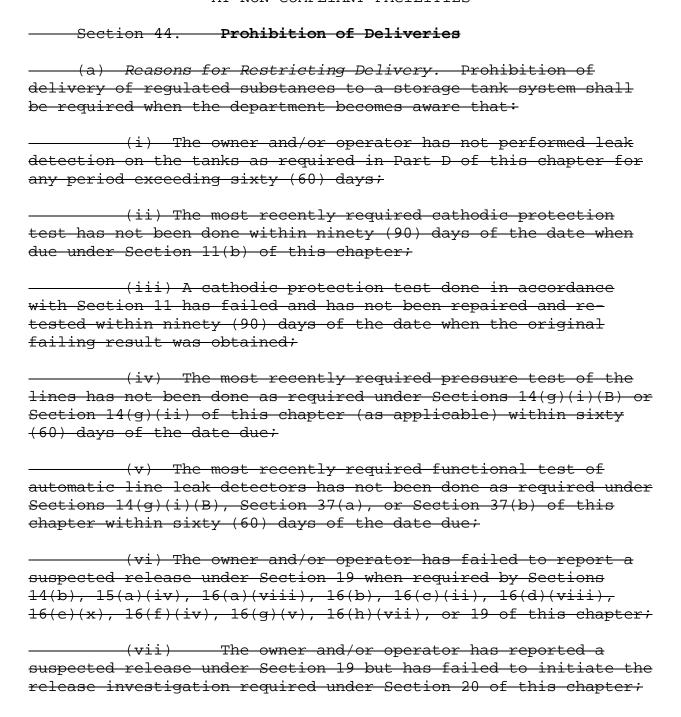

Values for inhalation toxicological reference doses (RfDi) and/or cancer potency factors (CPFi) shall be obtained from current data in the U.S. Environmental Protection Agency's Integrated Risk Information System (IRIS), the Health Effects Assessment Summary Tables (HEAST), or the EPA Region IX Preliminary Remediation Goals Data Base. Where toxicological data is not listed in these references, the administrator will establish the appropriate airborne concentration standard.

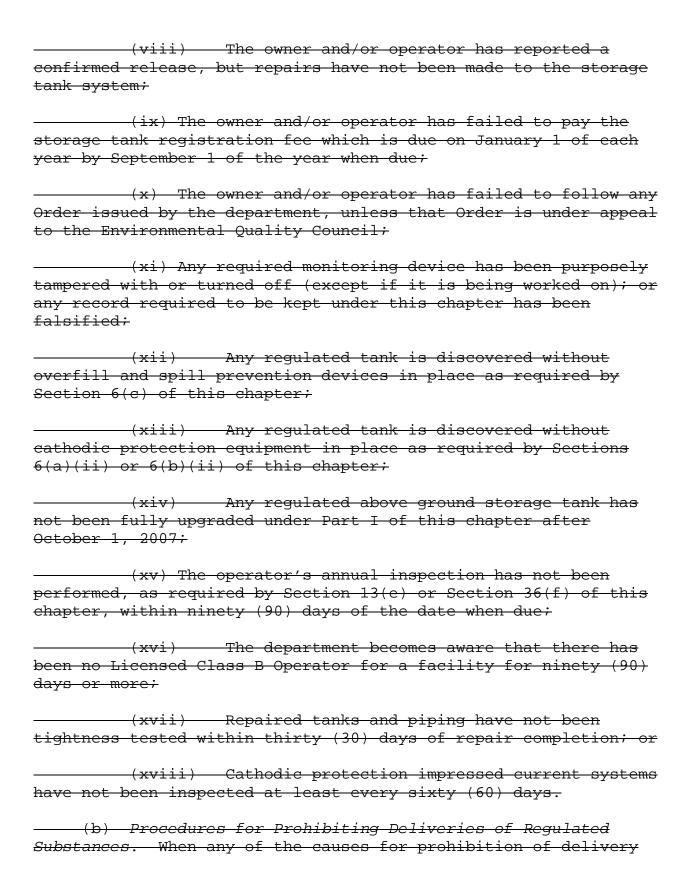

When an airborne concentration is confirmed in any building that equals or exceeds calculated concentrations and the source of the contaminant airborne concentration is known to be associated with a leaking storage tank release, immediate action will be implemented to eliminate the airborne health hazard to the applicable airborne occupational or indoor air quality action level. Immediate action will continue until the airborne concentration(s) is below those levels specified in this section.

Section 43. Default Organic Compound and Total Petroleum Hydrocarbon Soil Cleanup Concentrations. When site specific geological data/information are not available to calculate acceptable soil cleanup concentrations, default remediation standards shall be based on a child's exposure using both oral ingestion and inhalation pathways, and the potential for soil contamination to migrate to groundwater. The default soil condition for organic compounds has been established as a sandy clay formation with a minimal organic carbon content of 0.1% and a depth to the first groundwater table from the bottom of the default contaminated soil zone equal to one foot. The default thickness of contaminated soil is five (5) feet. The annual precipitation rate is fourteen (14) inches per year with a 50% infiltration rate. These conservative default soil conditions indicate residential exposures with protection of groundwater quality to EPA/WDEQ drinking water or equivalent drinking water levels.

PART K

PROHIBITION OF DELIVERIES AT NON-COMPLIANT FACILITIES

exist as shown in paragraph (a) of this section the department shall issue an Administrative Order to prohibit deliveries of the regulated substance.

The Wyoming Fuel Tax Administration tracks fuel suppliers of record for all storage tank facilities selling gasoline or diesel. The department shall obtain, from the Wyoming Fuel Tax Administration, the names of suppliers of record for any facility which is the subject of an Administrative Order under this subsection. When there are suppliers of record with the Wyoming Fuel Tax Administration, those suppliers shall also be ordered not to deliver regulated substances in the Administrative Order. (i) Administrative Orders issued under this Part shall include the following information: (A) The name of the Owner and/or Operator of the storage tank system; (B) The street address of the facility where the storage tank system is located; (C) The Storage Tank Program Facility ID Number; (D) The specific tanks at the facility which are restricted, or if all tanks at the facility are restricted; and (E) The reason for the restriction; (ii) An Administrative Order issued under this section is final as soon as signed by the Director. Administrative Orders may be appealed to the Environmental Quality Council under W.S. 35-11-701; (iii) The department shall immediately issue a Notice of Compliance to all entities covered by the Administrative Order that lifts the prohibition whenever the facility has been returned to compliance. Such notice shall include the same information found in Section 44(b)(i)(A) through (D);

(c) Posting on the internet. The department shall immediately post a copy of the Administrative Order on its website whenever a facility is prohibited from accepting

deliveries of regulated substances. The department shall also

post a Notice of Compliance on its website when the prohibition has been lifted. The notices will state which tanks at the facility are affected.

(d) Red Tagging. The department may, at any time after issuing an Administrative Order under this Part, place a tag on the affected tanks stating:

"DELIVERY PROHIBITION

Deliveries of any regulated substance to this tank have been prohibited by the State of Wyoming, Storage Tank Program. Delivery of any regulated substance to this tank while the delivery prohibition exists is a violation of Chapter 17, Part K, Wyoming Water Quality Rules and Regulations."

(e) Violation of this Part. It is a violation of this Part for any person to purchase a regulated substance for delivery to, or to deliver a regulated substance to, any storage tank that is the subject of any Administrative Order issued under this Part.

PART L

LICENSING OF STORAGE TANK OPERATORS, INSTALLERS, AND TESTERS

Section 45. Licensing of Installers (a) License Required. During the installation or modification of any UST or AST regulated by this chapter, at least one person, present on the job site, shall be licensed by the department to install or modify fuel tanks. To obtain these licenses, each person shall submit documentary evidence that he or she has passed the following tests within the three (3) years preceding the application date: (i) All Licensed Installers: (A) The International Code Council test on Wyoming State Specific Storage Tank Laws. (B) A current certificate for Hazardous Waste Operations and Emergency Response as required by the Wyoming Department of Employment, Occupational Health and Safety, Chapter 7, Section 1910.120. (ii) Licensed UST Installers. UST installers shall pass the International Code Council UST Installation and Retrofitting test; (iii) Licensed AST Installers. AST installers shall pass the International Code Council test entitled AST Installation and Retrofitting test; (b) License Renewal. Persons who are licensed as UST or AST installers shall renew their license every three (3) years. (c) Reciprocity with Other States and Cities. After evaluation of the other state or city's licensing requirements, the State of Wyoming Storage Tank Program may accept a license from any adjacent state, or any city in Wyoming, in lieu of the International Code Council tests required in Section 45(a)(ii)

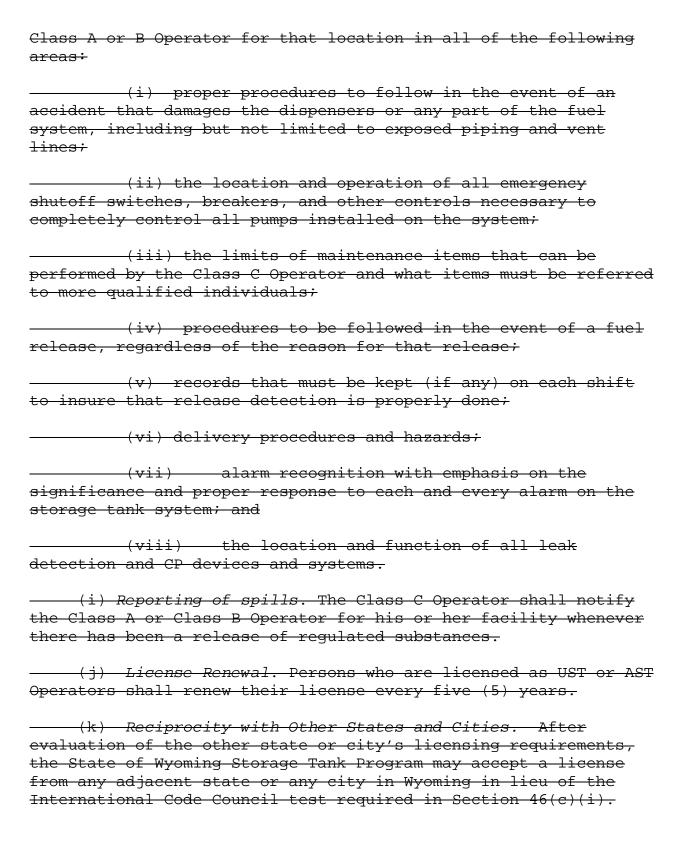

Section 46. Licensing of Operators of Storage Tanks

and (iii).

- (a) Class A Operator. Each facility shall be under the supervision of a person who has obtained a Class A Storage Tank Operator's License. To obtain a Class A Storage Tank Operator's License, each person shall submit documentary proof that they have passed The International Code Council test on "Wyoming State Specific Storage Tank Laws ICC Test W 6." A Class A Operator is generally the area manager for a company with multiple locations.
- (b) Class B Operator. All owners and/or operators of storage tanks in Wyoming shall insure that the person who is in responsible charge of the day-to-day operation of the storage tanks obtains a license from the department. For facilities used to fuel vehicles, the person in responsible charge cannot also be in responsible charge of more than fifteen (15) facilities at the same time.
- (c) Timing. Within ninety (90) days of the first date of employment with the company, the Class A and Class B operators shall obtain a Class A or B Storage Tank Operator's license from the department. To obtain this license, each person shall submit documentary evidence that he or she has passed the following tests within the five (5) years preceding the application date:
- (i) UST Operators. The International Code Council test "ICC BU Class B UST System Operator Exam" (Class B for UST operators); and/or
- (ii) AST Operators. The International Code Council test "Wyoming AST System Operators ICC Test W 5" (Class B for AST operators); or
- (iii) In lieu of both of the above tests, the International Code Council test "Wyoming State Specific Storage Tank Laws ICC Test W-6" (Class A operators).
- (d) Inspection by the Class A or B Operator. This paragraph does not apply to tanks supplying fuel to emergency power generators. Whenever a Class A operator is in charge of more than one facility, a monthly inspection is required. Either the Class A or B Operator for each facility must perform a monthly visual inspection of each storage tank system for which they are designated. The results of each inspection shall be recorded on a monthly inspection checklist.

(i) Every facility subject to this paragraph must be inspected monthly. The monthly visual inspection shall include inspections for all of the following: (a) the presence of any sensor alarm conditions, responding to alarm conditions appropriately; (b) the integrity of the spill containment (cracks, holes, bulges, etc.) and for the presence of regulated substance, water, or debris in spill containers (fill and vapor recovery); (c) the condition of all single wall piping sumps; and (d) the hanging hardware on dispensers and other visible piping for the presence of regulated substance leakage. (ii) Double wall piping sumps shall be inspected quarterly. If there is any alarm condition on any double wall system, the appropriate sump(s) must be opened, inspected, and cleaned if necessary. The sump sensors must be placed back within one half (1/2) inch of the bottom of the sump. e) Documentation. The Class A or B Operator shall provide the owner or operator with a copy of each monthly inspection checklist and alert the owner or operator of any condition discovered during the monthly visual inspection that may require follow-up actions. (f) Records. The owner or operator shall maintain a copy of the monthly inspection checklist and all attachments for the previous twelve (12) months. The records shall be maintained on site or off-site at a readily available location within the State of Wyoming. (g) Unattended Stations. For unattended stations, the Class A, B, or C Operator shall visit the site on a daily basis as required by the International Fire Code, Section 2204.3.1. (h) Class C Operators (Service Station Clerks). The Class C Operator must be trained prior to assuming responsibility for responding to emergencies or alarms. Managers and fuel clerks who work at a service station or convenience store, but who are

not in responsible charge of the location, must be trained by the

(1) Recordkeeping. Tank owners shall maintain on-site a list of designated and trained Class C Operators (Service Station Clerks). (m) Retraining Required. When a Notice of Violation and Order is issued to a facility for any of the reasons listed in Section 44(a)(i) through (xviii), the Class B Operator must be retrained. Retraining shall be in the form of retaking (if previously taken) or taking (if not previously taken) and passing the "Wyoming State Specific Storage Tank Laws ICC Test W 6" exam. The Class B Operator shall take this test within ninety (90) days of the Notice of Violation date. If there is more than one Class B Operator for the facility, at a minimum one of the Class B Operators must take the exam. (n) Notification. When a licensed operator is no longer responsible for the facility, the facility owner or operator shall notify the department in writing within thirty (30) days of the date the operator is no longer responsible for the facility. Section 47. Licensing of Cathodic Protection Testers and Corrosion Experts. (a) Cathodic Protection Testers. Persons who perform any cathodic protection testing shall obtain a license from the department. To obtain this license, each person shall submit documentary evidence that he or she is: (i) certified by NACE as a cathodic protection tester within the three (3) years preceding the application date; or (ii) certified by the Steel Tank Institute as a cathodic protection tester within two (2) years preceding the application date. (b) Corrosion Experts. Persons who design any impressed current system or any sacrificial anode system or design any repair to these systems shall first be licensed by the department. To obtain a license, each person shall submit documentary evidence that he or she: (i) is certified as a corrosion expert by NACE, or (ii) possesses a current Professional Engineer's license issued by the Wyoming Board of Registration for

Professional Engineers and three (3) years experience in the field of cathodic protection.

- (c) License Renewal. Licenses issued for Cathodic Protection Testers and Corrosion Experts shall expire on the date when the underlying certification by NACE or STI expires, or on the same date when an underlying license issued by another state or city expires. Persons holding those licenses shall renew their license within ninety (90) days prior to the date when the license expires.
- (d) Reciprocity with Other States and Cities. After evaluation of the other state or city's licensing requirements, the State of Wyoming Storage Tank Program, may accept a license from any adjacent state, or any city in Wyoming, in lieu of the NACE certification or STI certification required in Section 47(a) and (b).

Section 48. Licensing of Tank and Line Testers.

- (a) License Required. Before performing tests in Wyoming, all tank and line testers shall obtain a license from the department. To obtain a license, each person shall submit documentary evidence that he or she has passed:
- (i) the International Code Council test entitled "Tank Tightness Testing ICC Test U 3" within the preceding two (2) years before the date of the application; and
- (ii) The manufacturers' training certification for the type of tank and line tests performed.
- (b) License Renewal. Persons who are licensed as Tank and Line Testers shall renew their license every two (2) years.
- (c) Reciprocity with Other States and Cities. After evaluation of the other state or city's licensing requirements, the State of Wyoming Storage Tank Program, may accept a license from any adjacent state, or any city in Wyoming, in lieu of the International Code Council test on Tank Tightness Testing required by Section 48(a)(i).

- Section 49. Revocation of Licenses. The department may revoke or refuse to issue any of the licenses required under Sections 45 through 47 of this chapter for the following reasons:
- (a) Submission of Falsified Data. Whenever the department has documentary proof that any of the information submitted to the department for the purpose of obtaining a license was falsified or misrepresented;
- (b) False Reporting. Submission of any report to the department which is shown by the tester as passing when the test actually shows a failing result; or
- (c) License Revoked. Whenever any of the issuing agencies (ICC, NACE, the Board of Registration for Professional Engineers, or the manufacturer of test equipment) revokes the certifications necessary that are required for a license.
- (d) Continuation of Expiring Licenses. When a licensee has made timely and sufficient application for the renewal of a license or a new license with reference to any activity of a continuing nature, the existing license does not expire until the application has been finally determined by the agency, and, in case the application is denied or the terms of the new license limited, until the last day for seeking review of the agency order or a later date fixed by order of the reviewing court.
- (e) Notification. Whenever the department intends to revoke any license issued under this section the department shall notify the licensee by certified mail (return receipt requested) or by process server, stating the facts or conduct which warrants the intended action. The licensee was given an opportunity to show compliance with all lawful requirements for the retention of the license. The licensee shall have fifteen (15) days from the date of his receipt of the notice to provide additional evidence or information with respect the revocation of the license. Revocation of licenses is a final agency action subject to appeal to the Environmental Quality Council under Chapter 1, Section 6, Wyoming Environmental Quality Council, Rules of Practice and Procedure.
- Section 50. Implementation of Part L. All persons required to have licenses under Part L shall obtain those licenses within one (1) year of the effective date of this

chapter or the date when they would otherwise be required to obtain those licenses, whichever is the later date.

APPENDIX A

Hazardous Substances.

The following is a list of chemical compounds considered to be hazardous substances by the tank program. Any tank containing any of these substances shall meet the standards found in Section 17 of this chapter.

TABLE 6
REGULATED HAZARDOUS SUBSTANCES

CAS		
Number	Substance Name	Synonyms
630206	1,1,1,2 Tetrachloroethane	Ethane, 1,1,1,2 tetrachloro
79345	1,1,2,2 Tetrachloroethane	Ethane, 1,1,2,2 tetrachloro
79005	1,1,2 Trichloroethane	Ethane, 1,1,2 trichloro
78999	1,1 Dichloropropane	
120821	1,2,4 Trichlorobenzene	
156605	1,2 Dichloroethylene	Ethene, 1,2 dichloro (E)
122667	1,2 Diphenylhydrazine	Hydrazine, 1,2 diphenyl
106887	1,2-Epoxybutane	
106990	1,3,-Butadiene	
142289	1,3-Dichloropropane	
542756	1,3-Dichloropropene	1-Propene, 1,3-dichloro-
1120714	1,3-Propane sultone	1,2-0xathiolane, 2,2-dioxide
764410	1,4 Dichloro 2 butene	2 Butene, 1,4 dichloro
123911	1,4 Dioxane	1,4 Diethylenedioxide
130154	1,4 Naphthoquinone	1,4 Naphthalenedione
5344821	1 (o Chlorophenyl)thiourea	Thiourea, (2 chlorophenyl)
591082	1 Acetyl 2 thiourea	Acetamide, N- (aminothioxomethyl)-
71363	1 Butanol	n Butyl alcohol
504609	1 Methylbutadiene	1,3-Pentadiene
	2,2' Bioxirane	1,2:3,4 Diepoxybutane
540841	2,2,4 Trimethylpentane	
	2,2-Dichloropropionic acid	

CAS Number	Substance Name	Synonyms
	2,3,4-Trichlorophenol	Dynonyms
	2,3,5-Trichlorophenol	
	2,3,6-Trichlorophenol

CHAPTER XIX

Financial Assurance for Underground Storage Tanks

Repealed

- Section 1. <u>Authority.</u> These standards are promulgated pursuant to the Wyoming Environmental Quality Act Statutes 35-11-101 through 35-11-1428, specifically Wyoming Statutes 35-11-1414 through 35-11-1428.

 Section 2. Purpose. The purpose of these rules and
- (a) Allow Wyoming to assume primacy of the U.S. Environmental Protection Agency underground storage tank program;

regulations is to:

- (b) Provide underground storage tank system owners and/or operators with the option of financial responsibility coverage to help meet the federal requirements.
- Section 3. Applicability. The requirements of this chapter apply to all owners and/or operators of an underground storage tank as defined in W.S. 35-11-1415.
- (a) This part applies to owners and/or operators of all petroleum underground storage tank systems as defined in Section 4 except as otherwise provided in this section.
- (b) Owners and/or operators of petroleum underground storage tank systems are subject to these requirements if they are in operation on or after the date for compliance established in Section 4.
- (c) State and federal government entities whose debts and liabilities are the debts and liabilities of a state or the United States are exempt from the requirements of this chapter.
- (d) If the owner and operator of a petroleum underground storage tank are separate persons, only one person is required to demonstrate financial responsibility; however, both parties are liable in event of noncompliance. Regardless of which party complies, the date set for compliance at a particular facility is determined by the characteristics of the owner as set forth in Section 4.

- Section 4. <u>Compliance Dates.</u> Compliance with Sections 4 and 6 includes the total number of owned and/or operated underground storage tanks, including not only those located in Wyoming, but also those located throughout the United States at all locations. Owners of petroleum underground storage tanks are required to comply with the requirements of this chapter by the following dates:
- (a) All petroleum marketing firms owning 1,000 or more underground storage tanks and all other underground storage tanks owners that report a tangible net worth of \$20 million or more to the U.S. Securities and Exchange Commission (SEC), Dun and Bradstreet, the Energy Information Administration, or the Rural Electrification Administration; January 24, 1989.
- (b) All petroleum marketing firms owning 100-999 underground storage tanks; October 26, 1989.
- (c) All petroleum marketing firms owning 13 99 underground storage tanks at more than one facility; April 26, 1991.
- (d) All petroleum underground storage tank owners not described in paragraphs (a), (b), or (c) of this section, excluding all local government entities; **December 31, 1993.**
- (e) All petroleum underground storage tank owners who are local government entities; February 18, 1994.
- Section 5. Financial Responsibility Term Definitions. The financial responsibility terms used in this chapter are defined in 40 CFR 280.92.
- Section 6. Amount and Scope of Required Financial Responsibility.
- (a) Owners and/or operators of petroleum underground storage tanks or contaminated sites not eligible for the state corrective action program must demonstrate financial responsibility for taking corrective action and for compensating third parties for bodily injury and property damage caused by accidental releases arising from the operation of petroleum underground storage tanks in at least the following per occurrence amounts:
- (i) For owners and/or operators of petroleum underground storage tanks that are located at petroleum marketing facilities, or that handle an average of more than 10,000 gallons

of petroleum per month based on annual through-put for the previous calendar year; **\$1 million.**

- (ii) For all other owners and/or operators of petroleum underground storage tanks; \$500,000.
- (b) For the purposes of Section 6 (c) and 6 (f) only, "a petroleum underground storage tank" means a single containment unit and does not mean combinations of single containment units.
- (c) Owners and/or operators of petroleum underground storage tanks not eligible for the state corrective action program must demonstrate financial responsibility for taking corrective action and for compensating third parties for bodily injury and property damage caused by accidental releases arising from the operation of petroleum underground storage tanks in at least the following annual aggregate amounts:
- (i) For owners and/or operators of 1 to 100 petroleum underground storage tanks, **\$1 million**, and;
- (ii) For owners and/or operators of 101 or more petroleum underground storage tanks, **\$2 million**.
- (d) Except as provided in Section 6 (e), an owner and/or operator not eligible for the state corrective action program shall use separate mechanisms or separate combinations of mechanisms in the full amount specified in Sections 6 (a) and 6 (c) to demonstrate financial responsibility for:
- (i) Taking corrective action; and
- (ii) Compensating third parties for bodily injury and property damage caused by sudden or non sudden accidental release.
- (e) If an owner and/or operator not eligible for the state corrective action program uses separate mechanisms or separate combinations of mechanisms to demonstrate financial responsibility for different petroleum underground storage tanks, the annual aggregate required shall be based on the number of tanks covered by each such separate mechanism or combination of mechanisms.
- (f) Owners and/or operators not eligible for the state corrective action program shall review the amount of aggregate assurance provided whenever additional petroleum underground storage tanks are acquired or installed. If the total number of petroleum underground storage tanks for which assurance must be

provided exceeds 100, the owner and/or operator shall demonstrate financial responsibility in the amount of at least \$2 million of annual aggregate assurance by the anniversary of the date on which the mechanism demonstrating financial responsibility became effective. If assurance is being demonstrated by a combination of mechanisms, the owner and/or operator shall demonstrate financial responsibility in the amount of at least \$2 million of annual aggregate assurance by the first-occurring effective date anniversary of any one of the mechanisms combined (other than a financial test or guarantee) to provide assurance.

- (g) The amounts of financial assurance required under this section exclude legal defense costs.
- (h) The required per occurrence and annual aggregate coverage amounts do not in any way limit the liability of the owner and/or operator.
- Section 7. <u>Allowable Mechanisms and Combinations of Mechanisms</u>.
- (a) Owners and/or operators of petroleum underground storage tanks or contaminated sites not eligible for the state corrective action program shall use any one or combination of the mechanisms to demonstrate financial responsibility under this chapter for one or more underground storage tanks. Demonstration shall be pursuant to the requirements of 40 CFR 280.95, 280.96, 280.97, 280.98, 280.99, 280.102, and/or 280.103 and for local governments, 280.104, 280.105, 280.106, and 280.107, and the demonstration must be executed on forms provided by the department. The allowable mechanisms include financial test of self-insurance, guarantee, insurance and risk retention group coverage, surety bond, letter of credit, and/or trust fund and additionally for local governments, a bond rating test, local government financial test, local government fund.
- (b) An owner and/or operator may use self-insurance in combination with a guarantee only if, for the purpose of meeting the requirements of the financial test under this section, the financial statements of the owner and/or operator are not consolidated with the financial statements of the guarantor.
- (c) The department's trust and agency account will serve as the standby trust fund as described in 40 CFR 280.103, which is required in conjunction with a guarantee, surety bond, and letter of credit.

Section 8. General Provisions for Allowable Mechanisms in
Wyoming.
<u>(a) Financial test of self-insurance and local government financial test.</u>
(i) The application and letter from the chief financial officer will be executed on forms provided by the department.
(ii) Accompanying the financial test of self insurance will be the audited financial statements prepared and certified by an independent certified public accountant to document data submitted.
(iii) The administrator shall make a determination within 60 days of owner and/or operator submission of all materials necessary to base a decision on the financial test of self-insurance. The administrator shall approve or reject such application and declare in writing his reasons for such action to the owner and/or operator. The decision will be based on all the information submitted to the department.
(b) Guarantee and local government guarantee.
(i) The application and the letter from the chief financial officer will be executed on forms provided by the department.
(ii) The owner operator shall submit with the application, documentation verifying the guarantor's power and authority to enter into guarantee agreements on behalf of the owner an/or operator.
(iii) Accompanying the financial test of self insurance will be the audited financial statements of the guarantor prepared and certified by an independent certified public accountant to document data submitted.
(iv) The administrator shall make a determination within 60 days of owner and/or operator submission of all materials necessary to base a decision on the financial test of self-insurance. The administrator shall approve or reject such application and declare in writing his reasons for such action to the owner and/or operator. The decision will be based on all the information submitted to the department.

19-5

(c) Insurance and risk retention group coverage.

(i) The certificate of insurance will be submitted on a form acceptable to the department. (ii) The insurance shall be issued by a company licensed to do business in Wyoming. (iii) Surplus line carriers will be in compliance with the surplus lines laws under Chapter 11 of the Wyoming Insurance Code. (iv) Risk retention groups shall be registered with the Wyoming Insurance Department. (d) Surety bond. (i) The surety bond will be executed on forms provided by the department. (ii) The surety company shall be licensed to do business in Wyoming. (iii) The bond shall be signed by an authorized Wyoming resident agent. (e) Letter of credit. The letter of credit will be executed in the format provided by the department. (f) Trust Fund. The trust agreement will be executed on forms provided by the department. (g) Standby trust fund (required in conjunction with guarantee, surety bonds and letters of credit). The department's trust and agency account will serve as the standby trust fund. (h) Bond rating test for local governments. The letter from the chief financial officer shall be executed on forms provided by the department. (i) Local government fund. The letter from the chief financial officer shall be executed on forms provided by the department. Section 9. Substitution of Financial Assurance Mechanisms by

Owner and/or Operator.

- (a) An owner and/or operator may substitute any alternate financial assurance mechanisms as specified in this chapter, provided that at all times he maintains an effective financial assurance mechanism or combination of mechanisms that satisfies the requirements of Section 6.
- (b) After obtaining alternate financial assurance as specified in this chapter, an owner and/or operator may cancel a financial assurance mechanism, after concurrence by the administrator, by providing notice to the provider of financial assurance.

Section 10. <u>Cancellation or Nonrenewal by a Provider of Financial Assurance.</u>

- (a) Except as otherwise provided, a provider of financial assurance may cancel or fail to renew an assurance mechanism by sending a notice of termination by certified mail to the owner and/or operator and the department.
- (i) Termination of a local government guarantee, a guarantee, a surety bond, or a letter of credit may not occur until 120 days after the date on which the owner and/or operator and the department receives the notice of termination, as evidenced by the return receipt, and upon receipt of the administrator's written consent, which may be granted only when the conditions of the financial assurance have been met.
- (ii) Termination of insurance, risk retention group coverage, or state funded assurance may not occur until 60 days after the date on which the owner and/or operator and the department receives the notice of termination, as evidenced by the return receipt.
- (b) If a provider of financial responsibility cancels or fails to renew for reasons other than incapacity of the provider as specified in Section 11, the owner and/or operator must obtain alternate coverage as specified in this section within 60 days after receipt of the notice of termination. If the owner and/or operator fails to obtain alternate coverage within 60 days after receipt of the notice of termination, the owner and/or operator must notify the administrator of such failure before the 60 day period ends and submit:
- (i) The name and address of the provider of financial assurance;

(ii) The effective date of termination; and (iii) The evidence of the financial assistance mechanism subject to the termination maintained in accordance with Section 11 (b). (c) The department shall provide notification by mail to any owner and/or operator utilizing the state corrective action and financial responsibility accounts whenever either account is incapable of paying for assured corrective actions or third party damages. The owner and/or operator shall have thirty (30) days from the date of notification to provide for alternate financial assurance. (d) Any self insurance may be cancelled by the operator only after ninety (90) days notice to the administrator, and upon receipt of the administrator's written consent, which may be granted only when the requirements of the bond have been fulfilled. Section 11. Reporting by Owner and/or Operator Who Is Not Eligible for the State Corrective Action Program. (a) An owner and/or operator who receives notification of the following must notify the department within five (5) days of: (i) Commencement of a voluntary or involuntary proceeding under Title 11 (Bankruptcy), U.S. Code, naming a provider of financial assurance as a debtor. (ii) Suspension or revocation of the authority of a provider of financial assurance to issue a financial assurance mechanism. (iii) Failure of a guarantor to meet the requirements of the financial test. (iv) Other incapacity of a provider of financial assurance, or; (v) As required by 40 CFR 280.95 (g) and Section 10 (b). (b) An owner and/or operator shall obtain and submit evidence of financial responsibility or appropriate forms required in Section 12 (b) within 30 days after the owner and/or

operator has received any notices listed under Section 11 (a).

- (c) An owner and/or operator shall report to the administrator as required by 40 CFR 280.95 (g) concerning self insurance.
- (d) Reporting is required under the conditions of Section 10 (b).
- (e) An owner and/or operator must certify compliance with the financial responsibility requirements of this chapter as specified in the new tank notification form when notifying the department of the installation of a new underground storage tank under Chapter XVII, Water Quality Rules and Regulations, Section 7.

Section 12. Recordkeeping.

- (a) Owners and/or operators must maintain evidence of all financial assurance mechanisms used to demonstrate financial responsibility under this chapter for an underground storage tank until released from the requirements under Section 14. An owner and/or operator must maintain such evidence at the underground storage tank site or the owner's or operator's place of business. Records maintained off site must be made available upon request of the department.
- (b) An owner and/or operator must maintain the following types of evidence of financial responsibility:
- (i) An owner and/or operator using an assurance mechanism specified in 40 CFR 280.95 through 280.99 or 280.102 or 280.104 through 280.107, must maintain a copy of the instrument worded as specified.
- (ii) An owner and/or operator using a financial test or guarantee must maintain a copy of the chief financial officer's letter based on year-end financial statements for the most recent completed financial reporting year. Such evidence must be on file no later than 120 days after the close of the financial reporting year.
- (iii) A local government owner or operator using the local government bond rating test must maintain a copy of its bond rating published within the last 12 months by Moody's or Standard & Poor's.
- (iv) A local government owner or operator using local government guarantee where the guarantor's demonstration of

financial responsibility relies on the bond rating test must maintain a copy of the guarantor's bond rating published within the last 12 months by Moody's or Standard & Poor's. (v) An owner and/or operator using an insurance policy or risk retention group coverage must maintain a copy of the signed insurance policy or risk retention group coverage policy, with the endorsement or certificate of insurance and any amendments to the agreements. (vi) An owner or operator using a local government fund must maintain the following documents: (A) A copy of the state constitutional provision or local government statute, charter, ordinance, or order dedicating the fund, and (B) Year end financial statements for the most recent completed financial reporting year showing the amount in the fund. If the fund is established using incremental funding backed by bonding authority, the financial statements must show the previous year's balance, the amount of funding during the year, and the closing balance in the fund. (C) If the fund is established using incremental funding backed by bonding authority, the owner or operator must also maintain documentation of the required bonding authority, including either the results of a voter referendum or attestation by the State Attorney General. (vii) A local government owner or operator using the local government guarantee supported by the local government fund must maintain a copy of the quarantor's year-end financial statements for the most recent completed financial reporting year showing the amount of the fund. <u>(viii) An owner and/or operator using an assurance</u> mechanism specified in 40 CFR 280.95 through 280.107, must maintain

Certification of Financial Responsibility

relevant information;

updated copy of a certification of financial responsibility worded as follows, except that instructions are to be replaced with the

[Owner and/or operator] hereby certifies that it is in compliance with the requirements of Chapter XIX of the Water Quality Division Rules and Regulations.

The financial assurance mechanism(s) used to demonstrate financial responsibility under this chapter is (are) as follows:

[For each mechanism, list the type of mechanism, name of issuer, mechanism number (if applicable), amount of coverage, effective period of coverage and whether the mechanism covers "taking corrective action" and/or "compensating third parties for bodily injury and property damage caused by" either "sudden accidental releases" or "non sudden accidental releases" or "accidental releases."]

[Signature of owner and/or operator,] [name of owner and/or operator,] [title,] [date,] [signature of witness or notary,] [name of witness or notary,] [date].

(ix) The owner and/or operator must update this certification whenever the financial assurance mechanism(s) used to demonstrate financial responsibility change(s).

Section 13. Drawing on Financial Assurance Mechanisms.

(a) The administrator shall require the guarantor, surety, or institution issuing a letter of credit to place the amount of funds stipulated by the administrator up to the limit of funds provided by the financial assurance mechanism into the department's trust and agency account, which operates as a standby trust, if:

(i) The owner and/or operator fails to establish alternate financial assurance within 60 days after receiving notice of cancellation of the guarantee, surety bond, letter of credit, or, as applicable, other financial assurance mechanism; and the administrator determines or suspects that a release from an underground storage tank covered by the mechanism has occurred and so notifies the owner and/or operator or the owner and/or operator has notified the administrator pursuant to Chapter XVII, Water Quality Rules and Regulations, Parts E or F, of a release from an underground storage tank covered by the mechanism, or;

(ii) The conditions of Sections 13 (b) (i) or (b) (ii) (A) or (B) are satisfied.

- (b) The administrator may draw on a standby trust fund when:
- (i) The administrator makes a final determination that a release has occurred and immediate or long term corrective action

for the release is needed, and the owner and/or operator, after appropriate notice and opportunity to comply, has not conducted corrective action as required under Chapter XVII, Water Quality Rules and Regulations, Part F, or;

(ii) The administrator has received certification from the owner and/or operator and the third party liability claimant(s) and from attorneys representing the owner and/or operator and the third-party liability claimant(s) that a third-party liability claim should be paid. The certification must be worded as specified in 40 CFR 280.108.

(iii) A valid final court order establishing a judgment against the owner or operator for bodily injury or property damage caused by an accidental release from an underground storage tank covered by financial assurance under this chapter and the administrator determines that the owner or operator has not satisfied the judgment.

(c) If the administrator determines that the amount of corrective action costs and third-party liability claims eligible for payment under Section 13 (b) may exceed the balance of the standby trust fund and the obligation of the provider of financial assurance, the first priority for payment shall be corrective action costs necessary to protect human health and the environment. The administrator shall pay third party liability claims in the order in which the administrator receives certifications under Section 13 (b) (ii), and valid court orders under Section 13 (b) (iii).

Section 14. Release From the Requirements. An owner and/or operator is no longer required to maintain financial responsibility under this chapter for an underground storage tank after the tank has been properly closed or, if corrective action is required, after corrective action has been completed and the tank has been properly closed as required by Chapter XVII, Water Quality Rules and Regulations, Part G.

Section 15. Bankruptcy or Other Incapacity of Owner and/or Operator or Guarantor of Financial Assurance. Within 10 days after commencement of a voluntary or involuntary proceeding under Title 11 (Bankruptcy), U.S. Code, naming a guarantor providing financial assurance as debtor, such guarantor must notify the owner and/or operator by certified mail of such commencement as required under the terms of the guarantee specified in 40 CFR 280.96.

Section 16. Replenish Guarantee, Letter of Credit, or Surety
Bonds.
— (a) Any time after a financial assurance mechanism under
this section is drawn on by the administrator below the full amount
of required coverage, the owner and/or operator shall:
(i) By the anniversary date of the financial mechanism,
replenish the value of financial assurance to equal the full amount
of required coverage; or
(ii) De the conjecture det et the figure is a manharitum
(ii) By the anniversary date of the financial mechanism,
acquire another financial assurance mechanism for the amount by which funds have been reduced; or
wirten runds nave been reduced, or
(iii) Within thirty (30) days of the withdrawal of
the deductible amount required under the state fund mechanism,
replenish the value of the required deductible coverage.
representation of the required deductible coverage.
(b) If at any time after a standby trust fund is funded upon
the instruction of the administrator with funds drawn from a
guarantee, letter of credit, or surety bond, and the amount in the
standby trust is reduced below the full amount of coverage
required, the owner and/or operator shall by the anniversary date
of the financial mechanism from which the funds were drawn:
(i) Replenish the value of financial assurance to equal
the full amount of coverage required, or;
(ii) Acquire another financial assurance mechanism for
the amount by which funds in the standby trust have been reduced.
(a) For numbered of this gostion, the full amount of serromese
(c) For purposes of this section, the full amount of coverage required is the amount of coverage to be provided by Section 6.
If a combination of mechanisms was used to provide the assurance
funds which are drawn upon, replenishment shall occur by the
earliest anniversary date amount the mechanisms.
called and the first of the modifications.
